## ACKNOWLEDGMENTS

The author derived much of the material in this thesis from two years of experience as a student in the Environmental Risk Assessment Program in Chiang Mai University. This international program gave him a great deal of formal training for the practical chemistry and biological monitoring.

Throughout the course of this study, the author would like to gratefully thank his thesis advisor, Assoc. Prof. Dr. Prasak Thavornyutikarn, for his kindness, encouragement and overall supervision, and Mr. William G. Prewett, coadvisor, for his invaluable guidance through the process of establishment of an analysis method and subsequent sample analysis as well as data processing. The author also expresses gratitude to Mr. James F. Maxwell, coadvisor, for his help in project design, identification of plant species, and, most importantly, his scientific spirit which encouraged the author to conduct this study successfully. The author is greatly indebted to Assoc. Prof. Dr. Ookaew Prakobitayakit, coadvisor, for her significant suggestions, and useful comment from initial creation of thesis idea until after thesis defense.

The author is thankful to Ms. Mayuree Promphutha of the Department of Geological Sciences, for her accessing necessary laboratory facilities and assistance during sample analysis. He also wishes to thank all the ERA academic staff and official. Without them, this thesis would not have been completed. Special thanks are extended to all ERA friends for their sharing ideas and cooperation.

Finally, words cannot adequately express the author's gratefulness for the love, and patience of his wife, Ye Ming.
