### **Acknowledgments**

Spending over two and a half years in the university studying Environmental Risk Assessment for Tropical Ecosystem (ERA), an international M.Sc. program, after a break of almost three years in the working career, has brought me back educational freshness and the feeling of being just a student having more time to myself and opportunities of using excuses.

However, I am now about to go back to the reality of the working world, and hopefully I will be able to practice those concepts I had learnt during the course. Looking toward such direction, there is one more thing I have to complete for the course, this research-thesis book. And in completing both the course and the research, I realize that there are several organizations and persons to be thanked as they have helped me out in getting through.

Without my scholarship from the German Government via the Deutsche Gesellschaft fuer Technische Zusammenarbeit (GTZ), I probably could not have completed the course and this research, so I would like to present here my gratitude to GTZ for such support. I also would like to give my great thanks to the ERA program and its staffs in providing me all administration works and advises.

A special thank you is also extended to Biology Department, Faculty of Science, Chiang Mai University, and the Biogas Advisory Unit (BAU) as they supported me with the working area, laboratory, facilities, and also the financial support for my research.

My special thanks of gratitude needs to be given to Assist. Prof. Dr. Siripen Traichaiyaporn, my thesis advisor and the chairman of thesis's examining committee, as well as Assoc. Prof. Dr. Vilaiwan Anusarnsunthorn and Dr. Nirandom Potikanond sit as members in the examining committee.

I also would like to thank Mr. James F. Maxwell and Ms. Pranee Palee from the herbarium at Biology Department, who help me identify aquatic plants and gave me lots of useful information. Much appreciation is also given to Mr. Thamrong Proongkiat and other members of the Phytoplankton and Water Quality Research Unit in helping me about laboratory work.

Another group of people I need to thank are all the young men who had helped me carry out the field works. They are my former students who were very energetic and keen to work. So thank you Nong, Wang, Mai, Bo, Kik, and So for your help.

My special thank is also given to Mr. Nathachai Tiengburanatam who always helped and advised me during my research work and thesis writing. All of his comments and advises were very useful and appreciated for my work. Many thanks is also to be given to all the BAU's staff for giving me such a very pleasant and friendly environment during working on my research at their site.

I would like to especially thank my mother and father for giving me the love and support which encouraged me to accomplish my goals.

Finally, turning to my side, always there is my wife, Susan who is now carrying our baby, "heart-beat" expected in November. With my love, I would like to thank her and our baby for always giving me a hopeful feeling and support in working.
