

## CHAPTER II

### PRELIMINARIES

In this chapter, we give some definitions, notations and theorems that will be used in the later chapters.

#### 2.1 Topological Spaces

**Definition 2.1.1** Let  $X$  be a set. A topology ( or topological structure ) in  $X$  is a family  $\mathfrak{T}$  of subset of  $X$  that satisfies :

- (i) Each union of members of  $\mathfrak{T}$  is also a member of  $\mathfrak{T}$ .
- (ii) Each finite intersection of members of  $\mathfrak{T}$  is also a member of  $\mathfrak{T}$ .
- (iii)  $\emptyset$  and  $X$  are members of  $\mathfrak{T}$ .

Each members of  $\mathfrak{T}$  is called *open*. A subset  $A$  of  $X$  is *closed* in  $X$  if  $X-A$  is open.

**Definition 2.1.2** A couple  $(X, \mathfrak{T})$  consisting of a set  $X$  and a topology  $\mathfrak{T}$  in  $X$  is called a topological space.

Note that in the set  $X \neq \emptyset$ , let  $\mathfrak{T} = P(X)$ . Then  $(X, \mathfrak{T})$  is topological space and it is called the discrete topological spaces.

**Definition 2.1.3** Let  $X$  be topological space and  $E \subseteq X$ , the closure of  $E$  in  $X$  is the set  $\overline{E} = \cap \{ K \subseteq X \mid K \text{ is closed and } E \subseteq K \}$ .

**Definition 2.1.4** Let  $X$  be a topological space and  $E \subseteq X$ , the interior of  $E$  in  $X$  is the set  $Int(E) = \cup \{ G \subseteq X \mid G \text{ is open and } G \subseteq E \}$ .

**Definition 2.1.5** Let  $(X, \mathfrak{T})$  be a topological space and  $Y \subseteq X$ , the collection  $\mathfrak{T}' = \{ G \cap Y \mid G \in \mathfrak{T} \}$  is a topology for  $Y$ , called the *relative topology* for  $Y$ . The fact that a subset of  $X$  is being given this topology is signified by referring to it as a *subspace* of  $X$ .

**Definition 2.1.6** Let  $(X, \mathfrak{T})$  be a topological space. A family  $\mathcal{B} \subseteq \mathfrak{T}$  is called a *basis* for  $\mathfrak{T}$  if each open set (that is, member of  $\mathfrak{T}$ ) is the union of members of  $\mathcal{B}$ .

**Definition 2.1.7** Let  $(X, \mathfrak{T})$  be a topological space, a *subbasis* for  $\mathfrak{T}$  (or a subbasis for  $X$ ) is a collection  $S \subseteq \mathfrak{T}$  such that the collection of all finite intersections of elements from  $S$  forms a basis for  $\mathfrak{T}$ .

**Theorem 2.1.8** Let  $\mathcal{B} = \{ U_\mu \mid \mu \in I \}$  be any family of subsets of  $X$  that satisfies the following condition :

For each  $(\mu, \lambda) \in I \times I$  and each  $x \in U_\mu \cap U_\lambda$ , there exists some  $U_\alpha$  with  $x \in U_\alpha \subseteq U_\mu \cap U_\lambda$ .

Then the family  $\mathfrak{T}(\mathcal{B})$  consisting of  $\emptyset$ ,  $X$  and all unions of members of  $\mathcal{B}$ , is a topology for  $X$ ; that is,  $\mathcal{B} \cup \{ \emptyset \} \cup \{ X \}$  is a basis for some topology.  $\mathfrak{T}(\mathcal{B})$  is unique and is the smallest topology containing  $\mathcal{B}$ .

**Proof.** see [4] page 67.

## 2.2 Continuous Functions

**Definition 2.2.1** Let  $(X, \mathfrak{T}_X)$  and  $(Y, \mathfrak{T}_Y)$  be topological spaces. A map  $f: X \rightarrow Y$  is called *continuous* if the inverse image of each open set in  $Y$  is open in  $X$ .

**Theorem 2.2.2** Let  $X, Y$  be topological spaces and  $f: X \rightarrow Y$  a map. The following statements are equivalent:

- (i)  $f$  is continuous.
- (ii) The inverse image of each closed set in  $Y$  is closed in  $X$ .
- (iii) If  $E \subseteq X$ , then  $f(\overline{E}) \subseteq \overline{f(E)}$ .

*Proof.* see [2] page 59.

**Theorem 2.2.3** Let  $X, Y$  and  $Z$  be topological spaces. If  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  are continuous, then  $g \circ f: X \rightarrow Z$  is continuous.

*Proof.* see [8] page 45.

**Definition 2.2.4** Let  $X$  and  $Y$  be topological spaces. A map  $f: X \rightarrow Y$  is called *open* if image of each open in  $X$  is open in  $Y$ .

## 2.3 Product Spaces

**Definition 2.3.1** Let  $\{X_\alpha \mid \alpha \in I\}$  be a family of sets. The *Cartesian product* of the sets  $X_\alpha$  is the set

$$\prod_{\alpha \in I} X_\alpha = \left\{ f: I \rightarrow \bigcup_{\alpha \in I} X_\alpha \mid f(\alpha) \in X_\alpha \text{ for each } \alpha \in I \right\}.$$

In practice the value of  $f \in \prod_{\alpha \in I} X_\alpha$  at  $\alpha$  is usually denoted by  $f_\alpha$  rather than  $f(\alpha)$  and  $f_\alpha$  is referred to as the  $\alpha$ th coordinate of  $f$  and  $f$  is denoted by  $(x_\alpha)_{\alpha \in I}$ . The space  $X_\alpha$  is the  $\alpha$ th factor space.

The map  $\pi_\beta : \prod_{\alpha \in I} X_\alpha \rightarrow X_\beta$  defined by  $\pi_\beta((x_\alpha)_{\alpha \in I}) = x_\beta$  is called the projection map of  $\prod_{\alpha \in I} X_\alpha$  on  $X_\beta$  or more simply the  $\alpha$ th projection map.

**Definition 2.3.2** Let  $\{X_\alpha \mid \alpha \in I\}$  be any family of topological spaces. For each  $\alpha \in I$ , let  $\mathfrak{T}_\alpha$  be the topology for  $X_\alpha$ . The cartesian product topology in  $\prod_{\alpha \in I} X_\alpha$  is that having  $S = \{\pi_\beta(U_\beta) \mid U_\beta \in \mathfrak{T}_\beta, \beta \in I\}$  as a subbasis.

**Theorem 2.3.3** Let  $\{X_\alpha \mid \alpha \in I\}$  be any family of topological spaces. Then for each fixed  $\beta \in I$ , the projection  $\pi_\beta : \prod_{\alpha \in I} X_\alpha \rightarrow X_\beta$  is a continuous open onto.

*Proof.* see [4] page 101.

**Theorem 2.3.4** Let  $\{Y_\alpha \mid \alpha \in I\}$  be any family of topological spaces, and  $f : X \rightarrow \prod_{\alpha \in I} Y_\alpha$  a map. Then  $f$  is continuous if and only if  $\pi_\alpha \circ f$  is continuous for each  $\alpha \in I$ .

*Proof.* see [4] page 101.

**Theorem 2.3.5** Let  $\{X_\alpha \mid \alpha \in I\}$  and  $\{Y_\alpha \mid \alpha \in I\}$  be any family of topological spaces. For each  $\alpha \in I$ , let  $f_\alpha : X_\alpha \rightarrow Y_\alpha$  be a map. Define  $\prod f_\alpha : \prod_{\alpha \in I} X_\alpha \rightarrow \prod_{\alpha \in I} Y_\alpha$  by  $(x_\alpha)_{\alpha \in I} \rightarrow (f_\alpha(x_\alpha))_{\alpha \in I}$ . Then :

- (i) If each  $f_\alpha$  is continuous, so also is  $\prod f_\alpha$ .
- (ii) If each  $f_\alpha$  is an open map, and all but at most finitely many are surjective, then  $\prod f_\alpha$  is also an open map.

*Proof.* see [4] page 102.

## 2.4 Separation Axioms

**Definition 2.4.1** A topological space  $X$  is a  $T_0$ -space if whenever  $x$  and  $y$  are distinct points in  $X$ , there is an open set containing one and not the other.

**Definition 2.4.2** A topological space  $X$  is a  $T_1$ -space if whenever  $x$  and  $y$  are distinct points in  $X$ , there is a neighborhood of each not containing the other.

**Theorem 2.4.3** A topological space  $X$  is a  $T_1$ -space if and only if each singleton subset of  $X$  is closed.

*Proof.* see [2] page 80.

**Definition 2.4.4** A topological space  $X$  is a  $T_2$ -space (Hausdorff) if whenever  $x$  and  $y$  are distinct points of  $X$ , there are disjoint open sets  $U$  and  $V$  with  $x \in U$  and  $y \in V$ .

## 2.5 Connected Spaces

**Definition 2.5.1** A topological space  $Y$  is *connected* if it is not the union of two nonempty disjoint open sets.

**Theorem 2.5.2** Let  $(X, \mathfrak{T})$  be any topological space. Then the following statement are equivalent.

- (i)  $X$  is connected.
- (ii)  $X$  cannot be expressed as the union of two disjoint nonempty closed subsets.
- (iii) The only subsets of  $X$  which are open and closed are  $X$  and  $\emptyset$ .
- (iv) Let  $Y = \{0, 1\}$  have the discrete topology. Then there is no continuous function from  $X$  onto  $Y$ .

*Proof.* see [5] page 185.

**Theorem 2.5.3** Let  $X$  be connected and  $Y$  be topological space. If  $f: X \rightarrow Y$  is continuous and onto, then  $Y$  is connected.

*Proof.* see [2] page 100.

## 2.6 Regular Generalized Closed Sets

**Definition 2.6.1** A subset  $A$  of a topological space  $X$  is said to be *regular open* if  $A = \text{Int}(\overline{A})$ .

**Definition 2.6.2** A subset  $A$  of a topological space  $X$  is said to be *regular closed* if  $A = \overline{\text{Int}(A)}$ .

**Definition 2.6.3** A subset  $A$  of a topological space  $X$  is called *g-closed* in  $X$  if  $\overline{A} \subseteq G$  whenever  $A \subseteq G$  and  $G$  is open in  $X$ . A subset  $A$  is called *g-open* in  $X$  if its complement,  $A^c$ , is *g-closed*.

**Theorem 2.6.4** *Let  $X$  be topological space and  $A \subseteq X$ . Then  $A$  is  $g$ -open if and only if  $F \subseteq \text{Int}(A)$  whenever  $F$  is closed and  $F \subseteq A$ .*

*Proof.* see [6] page 206.

**Definition 2.6.5** A subset  $A$  of a topological space  $X$  is called  $r$ - $g$ -closed in  $X$  if  $\bar{A} \subseteq G$  whenever  $A \subseteq G$  and  $G$  is regular open in  $X$ . A subset  $A$  is called  $r$ - $g$ -open in  $X$  if its complement,  $A^c$ , is  $r$ - $g$ -closed.

**Theorem 2.6.6** *Let  $X$  be a topological space and  $A, B \subseteq X$ . If  $A$  and  $B$  are  $r$ - $g$ -closed sets, then  $A \cup B$  is  $r$ - $g$ -closed.*

*Proof.* see [7] page 212.

**Theorem 2.6.7** *Let  $X$  be topological space and  $B \subseteq A \subseteq X$ . If  $B$  is  $r$ - $g$ -closed set relative to  $A$  and  $A$  is a  $g$ -closed open subset in  $X$ , then  $B$  is  $r$ - $g$ -closed in  $X$ .*

*Proof.* see [7] page 212.

**Theorem 2.6.8** *Let  $X$  be topological space and  $A \subseteq X$ . Then  $A$  is  $r$ - $g$ -open if and only if  $F \subseteq \text{Int}(A)$  whenever  $F$  is regular closed and  $F \subseteq A$ .*

*Proof.* see [7] page 215.
