ACKNOWLEDGEMENT

I would like to express my deep appreciation and sincere gratitude to my advisors for their scholarly guidance, encouragement, and valuable support. I am fortunate to have Dr. Paungpayom Panya as my major advisor, who generously shared her talents and time with me throughout this study and helped me making my dream come true. Equal thanks go to my co-advisor, Dr. Sirirat Panuthai, for her inspiration and kind support.

Sincere appreciation is extended to my thesis committee members: Associate Professor Dr. Sukanya Parisunyakul and Professor Zhang Shulin.

I also extend my special and sincere appreciation to the nursing experts, who are in the Faculty of Nursing of Chiang Mai University and Shanghai Medical University, for their validation for the data collection instruments of this study and having offered constructive and valuable suggestions to my research.

Sincere appreciation is extended to my colleagues in Huashan Hospital and Zhongshan Hospital, Shanghai Medical University, for their support in the data collection procedure.

I am also grateful for the cooperation of all stroke survivors, who participated in this study. Without these people, this study would not have been possible and

successfully completed.

A very special thanks is extended to my family, for the consistent love and encouragement from my father, my mother and younger sister. The same thanks go to my fiancée, Mr. Cao Yugang, for his love and understanding during my study.

Further thanks are also extended to Chiang Mai University and Shanghai Medical University for providing me with the opportunity for the study. A sincere thanks is also extended to the China Medical Board of New York for providing financial support for the POHNED.
