ACKNOWLEDGEMENT

The author wishes to express her gratitude and deepest appreciation to Associate Professor Doctor Viboon Rattanapanone, thesis advisor, for his excellent guidance, grateful acknowledgement and kind encouragement throughout this study. This thesis would not have been accomplished without his help. She would like to extend her gracious thank to Associate Professor Doctor Usanee Viniketkumnuen, Associate Professor Doctor Thongnarth Kumjai and Assistant Professor Mallika Sookasam, her co-advisors, for their valuable advice, suggestion and sincere help. Additionally, she is always thankful to all the wonderful staff members in Department of Biochemistry, Faculty of Medicine, for their excellent instruction. Especially, Associate Professor Doctor Prachya Kongtawelert and his laboratory colleagues also kindly trained for ELISA and electrophoresis technique. Also, Doctor Somdet Srichairatanakool was provided his advice for the basic of HPLC technique. Their teaching and suggestion during the course work were very helpful for the understanding, solving the problem and enabling her to complete this thesis.

She is deeply impressed by the heartening, understanding and taking care from her family, especially, her husband and her two children for their love throughout her life.

Thanks for all members in Department of Oral Surgery, Faculty of Dentistry, Chiang Mai University who's received all workload during her study. The success of this thesis was supported by the grant from Faculty of Medicine Endowment fund for Medical Research
