Calculate Average for current month

```
Average(current reservoir, current month) =
```

$$(\text{MaxLimit}(\text{current reservoir, current month}) + \text{MinLimit}(\text{current reservoir, current month})) / 2$$

Define Calculation Periods

```

calcP = 1
StartMonth = 1 (or first month of maintenance schedule)
Do
  CalcPeriod(current reservoir, calcP).StartMonth = StartMonth
  StopMonth = StartMonth
  If StopMonth = total number of months Then
    CalcPeriod(current reservoir, calcP).StopMonth = StopMonth
    Exit Do
  Else
    Do until Average(current reservoir, StopMonth) <= Average(current reservoir, StopMonth + 1)
      StopMonth = StopMonth + 1
      If StopMonth >= total number of months Then
        CalcPeriod(current reservoir, calcP).StopMonth = StopMonth
        Exit Do
      End If
    Loop
  End If
  If StopMonth = StartMonth Then
    If Average(current reservoir, StopMonth) < Average(current reservoir, StopMonth + 1)
      Do
        StopMonth = StopMonth + 1
        If StopMonth >= total number of months Then
          CalcPeriod(current reservoir, calcP).StopMonth = StopMonth
          Exit Do
        End If
      Loop until Average(current reservoir, StopMonth) >= Average(current reservoir, StopMonth + 1)
    End If
  End If
  CalcPeriod(current reservoir, calcP).StopMonth = StopMonth
  If StopMonth >= total number of months Then
    Exit Do
  End If
  calcP = calcP + 1
  StartMonth = StopMonth + 1
Loop until StopMonth >= total number of months
TotalCalcPeriod(current reservoir) = calcP (save total number of calculation periods of current reservoir)

```

Calculate Release, HeadStart, and HeadStop in current Calculation Period

TotalInflow(current calcP) = Sum of InflowForecast(current reservoir, Month(month#) from
month# = StartMonth of current Calculation Period to StopMonth of current Calculation Period

Select Case current calcP

Case current calcP is first period

$$\text{Release}(\text{current reservoir, current calcP}) = \text{Reservoir}(\text{current reservoir}).\text{InitialVolume} \\ + \text{TotalInflow}(\text{current calcP}) \\ - \text{Average}(\text{current reservoir, StopMonth of Current calculation Period}) \\ - (\text{Reservoir}(\text{current reservoir}).\text{TotalEvap} * \text{number of months in current Calculation Period})$$

$$\text{HeadStart}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir, Reservoir}(\text{current reservoir}).\text{InitialVolume})$$

$$\text{HeadStop}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir,} \\ \text{Average}(\text{current reservoir, StopMonth of current Calculation Period}))$$

Case current calcP is between first period and last period

$$\text{Release}(\text{current reservoir, current calcP}) = \text{Average}(\text{current reservoir, StopMonth of previous Calculation Period}) \\ + \text{TotalInflow}(\text{current calcP}) \\ - \text{Average}(\text{current reservoir, StopMonth of Current calculation Period}) \\ - (\text{Reservoir}(\text{current reservoir}).\text{TotalEvap} * \text{number of months in current Calculation Period})$$

$$\text{HeadStart}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir,} \\ \text{Average}(\text{current reservoir, StopMonth of previous Calculation Period}))$$

$$\text{HeadStop}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir,} \\ \text{Average}(\text{current reservoir, StopMonth of current Calculation Period}))$$

Case current calcP is last period

$$\text{Release}(\text{current reservoir, current calcP}) = \text{Average}(\text{current reservoir, StopMonth of previous Calculation Period}) \\ + \text{TotalInflow}(\text{current calcP}) \\ - \text{Reservoir}(\text{current reservoir}).\text{EndedVolume} \\ - (\text{Reservoir}(\text{current reservoir}).\text{TotalEvap} * \text{number of months in current Calculation Period})$$

$$\text{HeadStart}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir,} \\ \text{Average}(\text{current reservoir, StopMonth of current Calculation Period}))$$

$$\text{HeadStop}(\text{current calcP}) = \text{HeadFunction}(\text{current reservoir,} \\ \text{Average}(\text{current reservoir, Reservoir}(\text{current reservoir}).\text{EndedVolume}))$$

End Select

Calculate CapacityGen and WaterRate for current generator of current reservoir in current Calculation Period

$$\text{CapacityGen}(\text{current generator, current calcP}) = \text{CapacityFunction}(\text{current generator,} \\ (\text{HeadStart}(\text{current reservoir, current calcP}) \\ + \text{HeadStop}(\text{current reservoir, current calcP})) / 2)$$

$$\text{WaterRate}(\text{current generator, current calcP}) = \text{WaterRateFunction}(\text{current generator,} \\ (\text{HeadStart}(\text{current reservoir, current calcP}) \\ + \text{HeadStop}(\text{current reservoir, current calcP})) / 2)$$

A.3 HeadFunction

Input:
- Reservoir Number
- Volume

Output:
- Head value

Calculate Head value with formula $y = V_a x^5 + V_b x^4 + V_c x^3 + V_d x^2 + V_e x + V_f$

```
Return Head = Reservoir(reservoir#).Va * Volume * Volume * Volume * Volume * Volume)
+ (Reservoir(reservoir#).Vb * Volume * Volume * Volume * Volume)
+ (Reservoir(reservoir#).Vc * Volume * Volume * Volume)
+ (Reservoir(reservoir#).Vd * Volume * Volume)
+ (Reservoir(reservoir#).Ve * Volume)
+ Reservoir(reservoir#).Vf
```

CapacityFunction

Input:
- Generator Number
- Head

Output:
- Capacity value (MW)

Calculate Head value with formula $Capacity = \frac{k_1 \times q \times head}{1000}$

```
Capacity = 0
Capacity = (Generator(generator#).k1 * Generator(generator#).q * Head) / 1000
If Capacity > Generator(generator#).Capacity Then
  (NOTE: If the calculated value is greater than unit's capacity, use the unit's capacity instead)
  Capacity = Generator(generator#).Capacity
End If
Return Capacity
```

WaterRateFunction

Input:
- Generator Number
- Head

Output:
- Water Rate

Calculate Water Rate with formula $WaterRate = \frac{q \times 3.6}{Capacity}$

```
Return WaterRate = (Generator(generator#).q * 3.6) / CapacityFunction(generator#, Head)
```

A.4 CalculateReservoirLimit

Input:

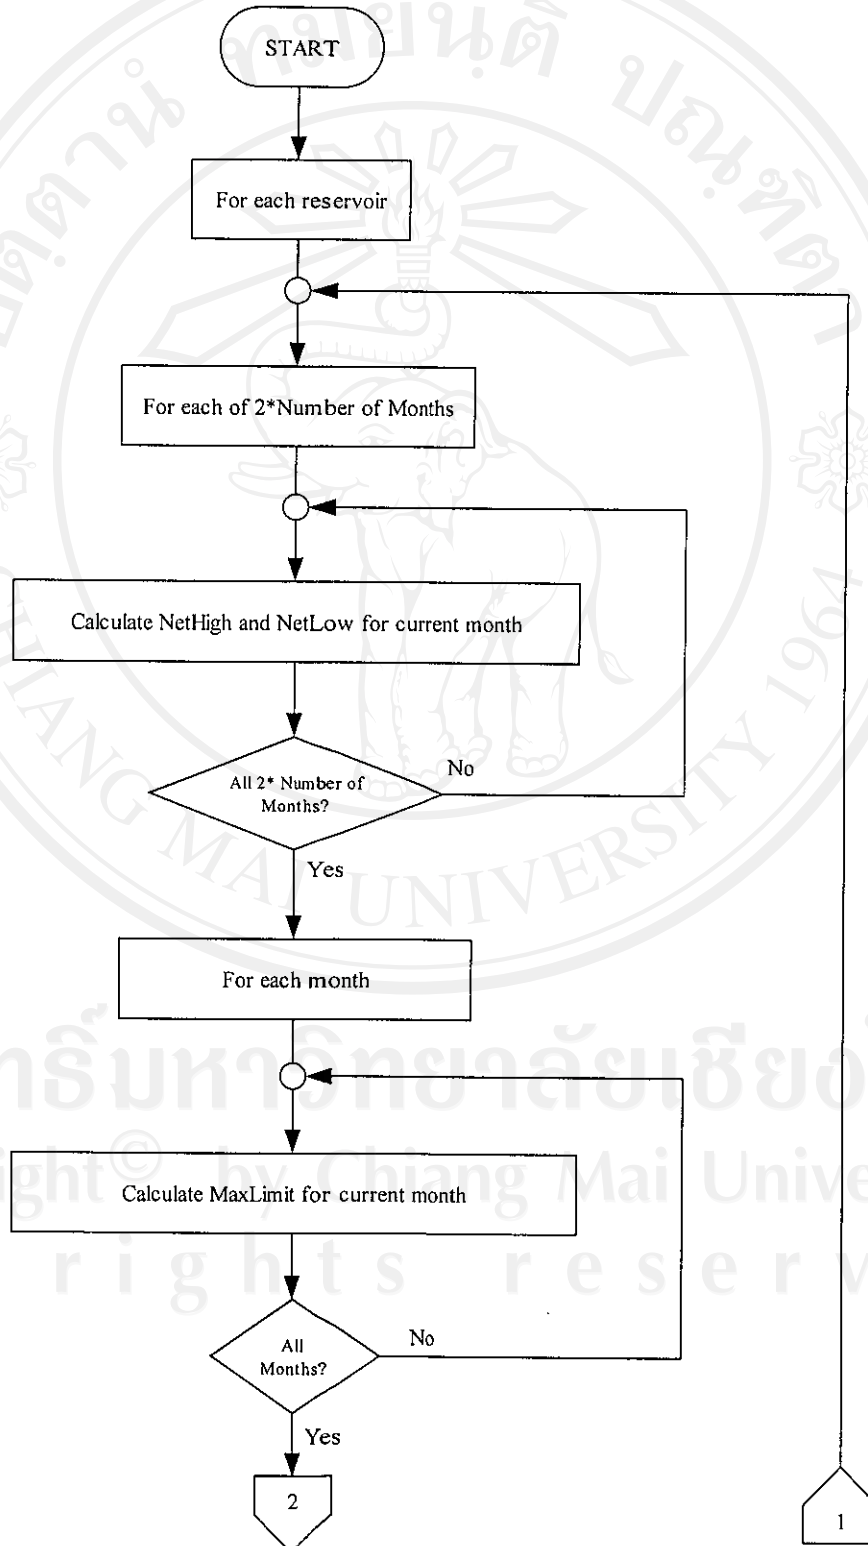

- PMin(reservoir#, month#)
- PMax(reservoir#, month#)
- Reservoir(reservoir#)

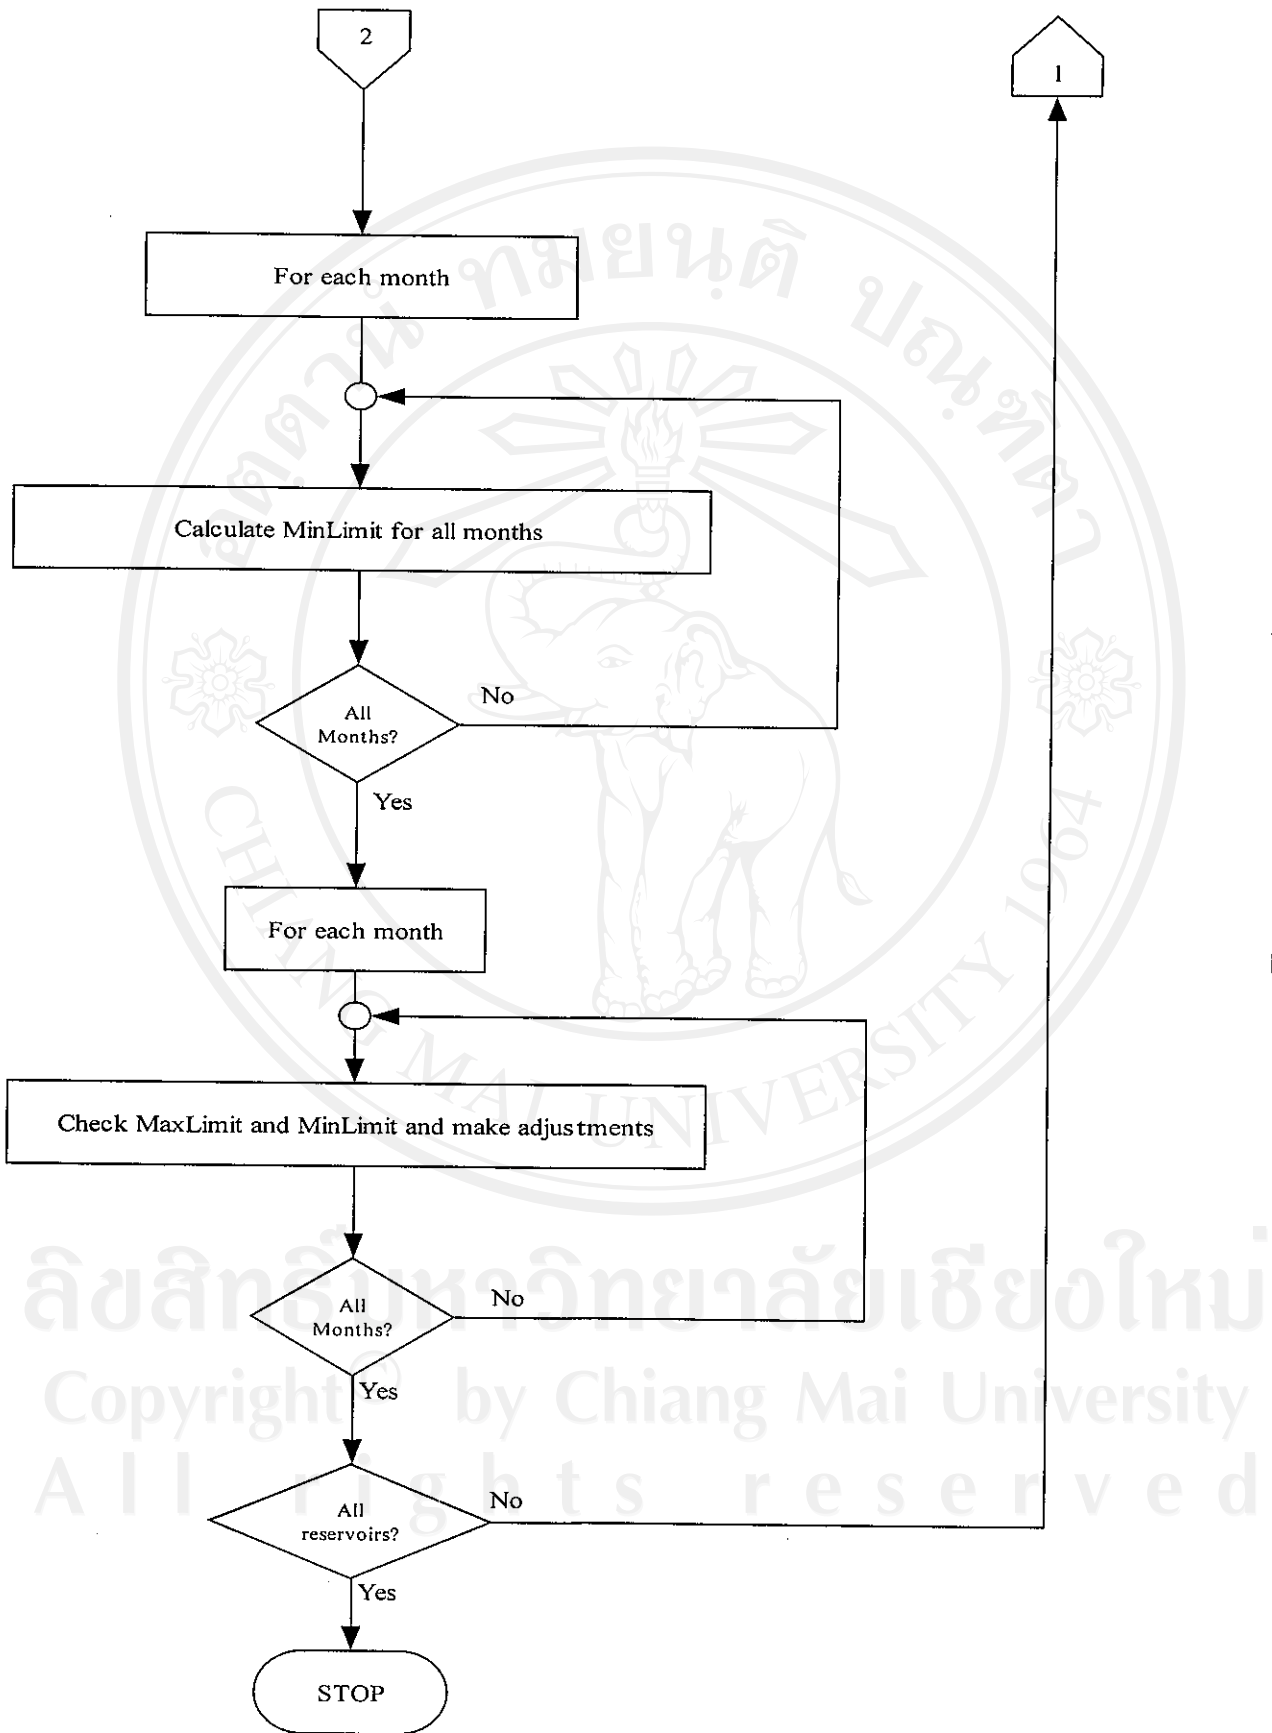

Output:

- MaxLimit(reservoir#, month#)
- MinLimit(reservoir#, month#)

LocalVariable:

- NetHigh(reservoir#, month#)
- NetLow(reservoir#, month#)

ลิขสิทธิ์มหาวิทยาลัยเชียงใหม่
Copyright © by Chiang Mai University
All rights reserved

Calculate NetHigh and NetLow for each of 2*Number of Months

```

NetHigh(current reservoir, current month) = PMax(current reservoir, current month) -
Reservoir(current reservoir).MaxTurbineFlow(current month)

NetHigh(current reservoir, current month + 12) = NetHigh(current reservoir, current month)

NetLow(current reservoir, current month) = PMin(current reservoir, current month) -
Reservoir(current reservoir).PeakOperation(current month)

NetLow(current reservoir, current month + 12) = NetLow(current reservoir, current month)

```

Calculate MaxLimit for each month

```

MaxLimit(current reservoir, current month) = Reservoir(current reservoir).Maxcapacity
next month = current month + 1
Do
  MaxLimit(current reservoir, current month) = MaxLimit(current reservoir, current month) -
  NetHigh(current reservoir, next month)
  next month = next month + 1
Loop Until NetHigh(current reservoir, next month) < 0

```

Calculate MinLimit for each month

```

MinLimit(current reservoir, current month) = 0
next month = current month + 1
Do
  MinLimit(current reservoir, current month) = MinLimit(current reservoir, current month) -
  NetLow(current reservoir, next month)
  next month = next month + 1
Loop Until NetLow(current reservoir, next month) < 0

```

Check MaxLimit and MinLimit and make adjustments for each month

```

If MaxLimit(current reservoir, current month) > Reservoir(current reservoir).Maxcapacity Then
  MaxLimit(current reservoir, current month) = Reservoir(current reservoir).Maxcapacity
End If

If MinLimit(current reservoir, current month) < 10% of Reservoir(current reservoir).Maxcapacity Then
  MinLimit(current reservoir, current month) = 10% of Reservoir(current reservoir).Maxcapacity
End If

If MaxLimit(current reservoir, current month) < MinLimit(current reservoir, current month) Then
  MaxLimit(current reservoir, current month) = MinLimit(current reservoir, current month)
End If

```

A.5 Search

Input:

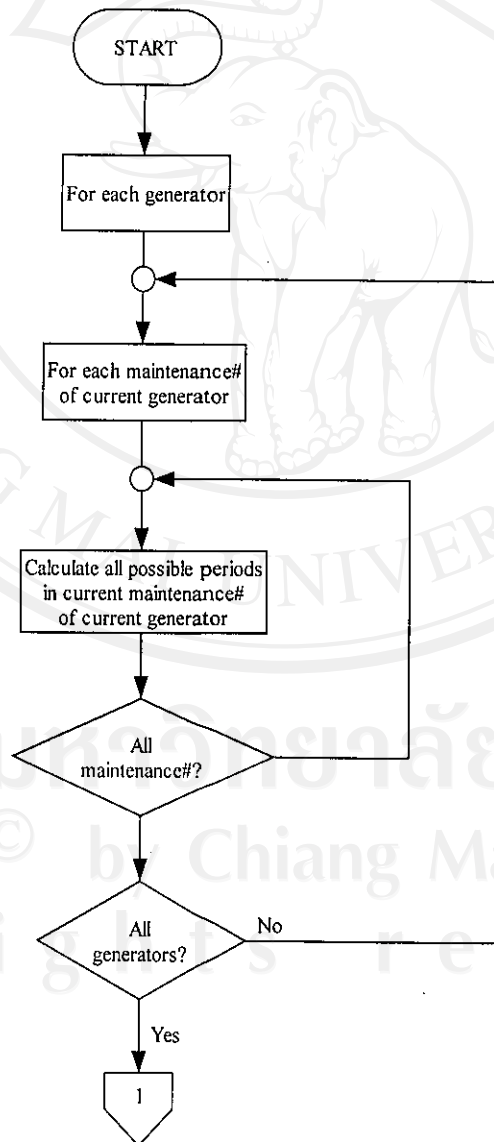

- DataGeneral
- Generator(generator#)
- Reservoir(reservoir#)
- ImportTariffData
- ExportTariffData
- LoadForecast(day#, hour#)
- LoadPeak(day#)
- MaintenanceInfo(generator#)
- InflowForecast(reservoir#)
- MaxLimit(reservoir#, month#)
- MinLimit(reservoir#, month#)
- Average(reservoir#, month#)
- CalcPeriod(reservoir#, month#)
- TotalCalcPeriod(reservoir#)
- Release(reservoir#, month#)
- CapacityGen(generator#, calcP#)
- WaterRate(generator#, month#)

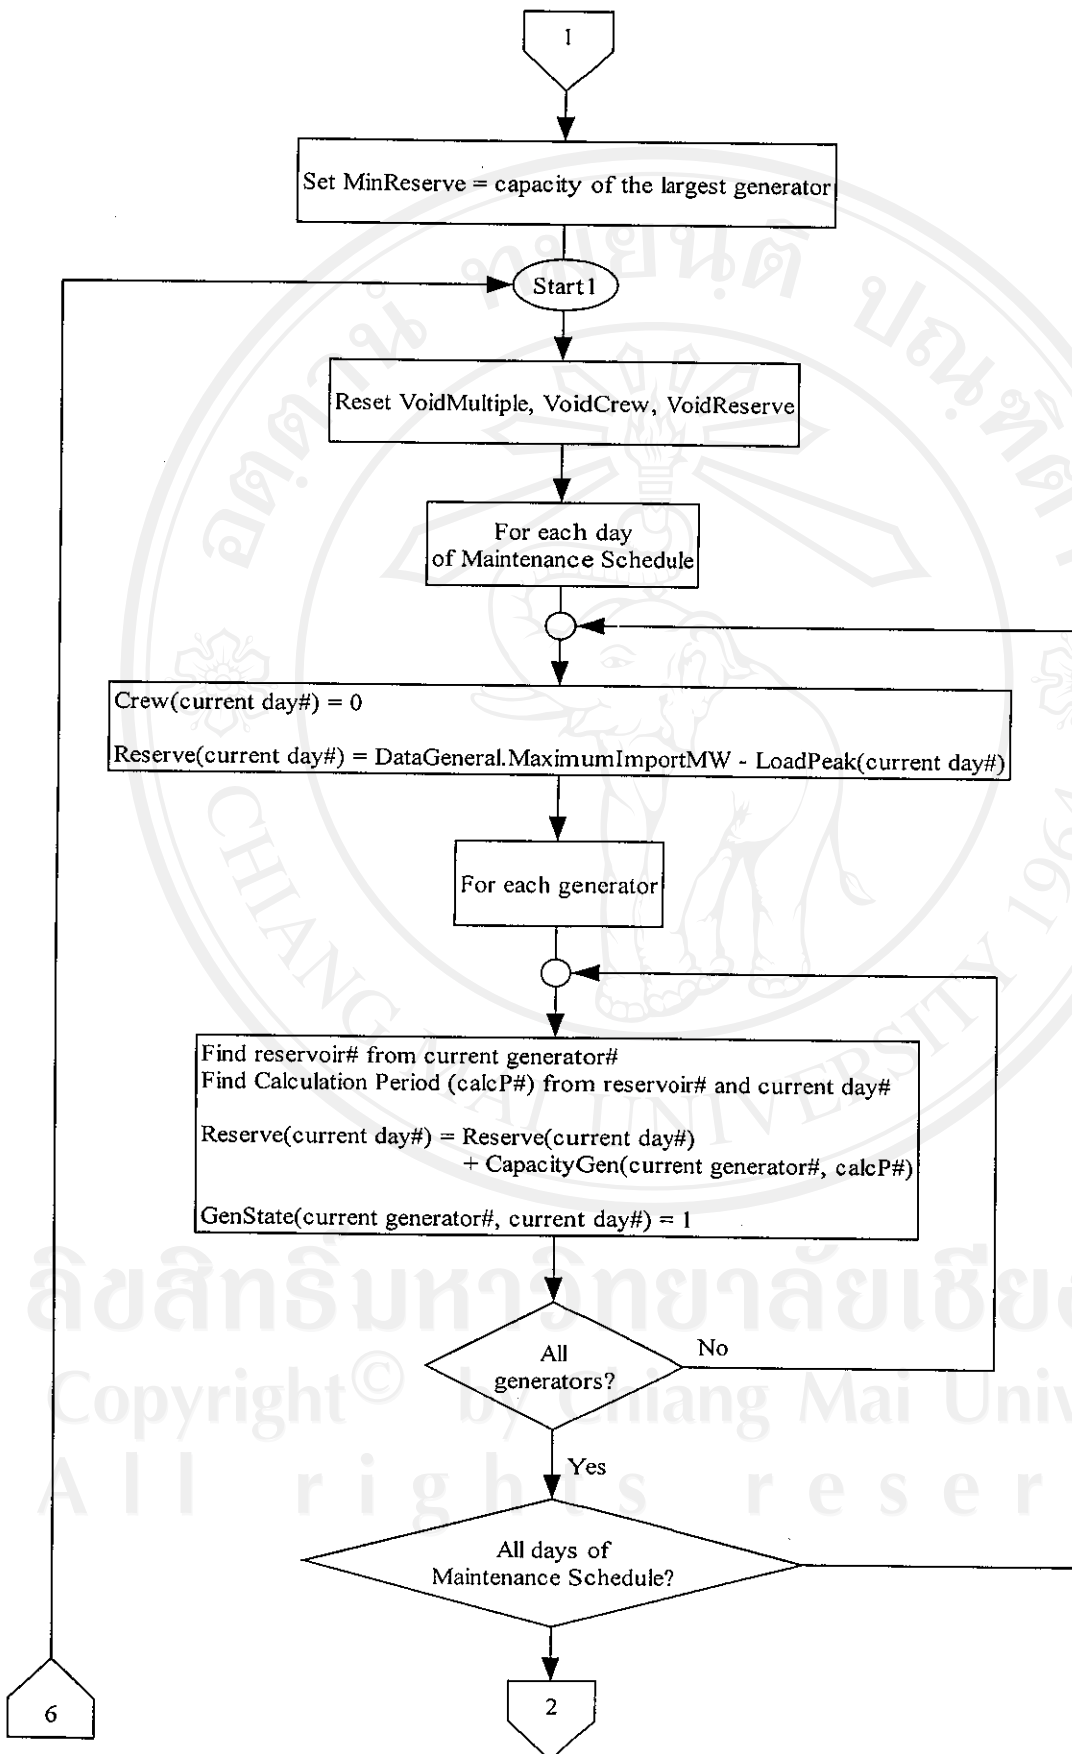

Output:

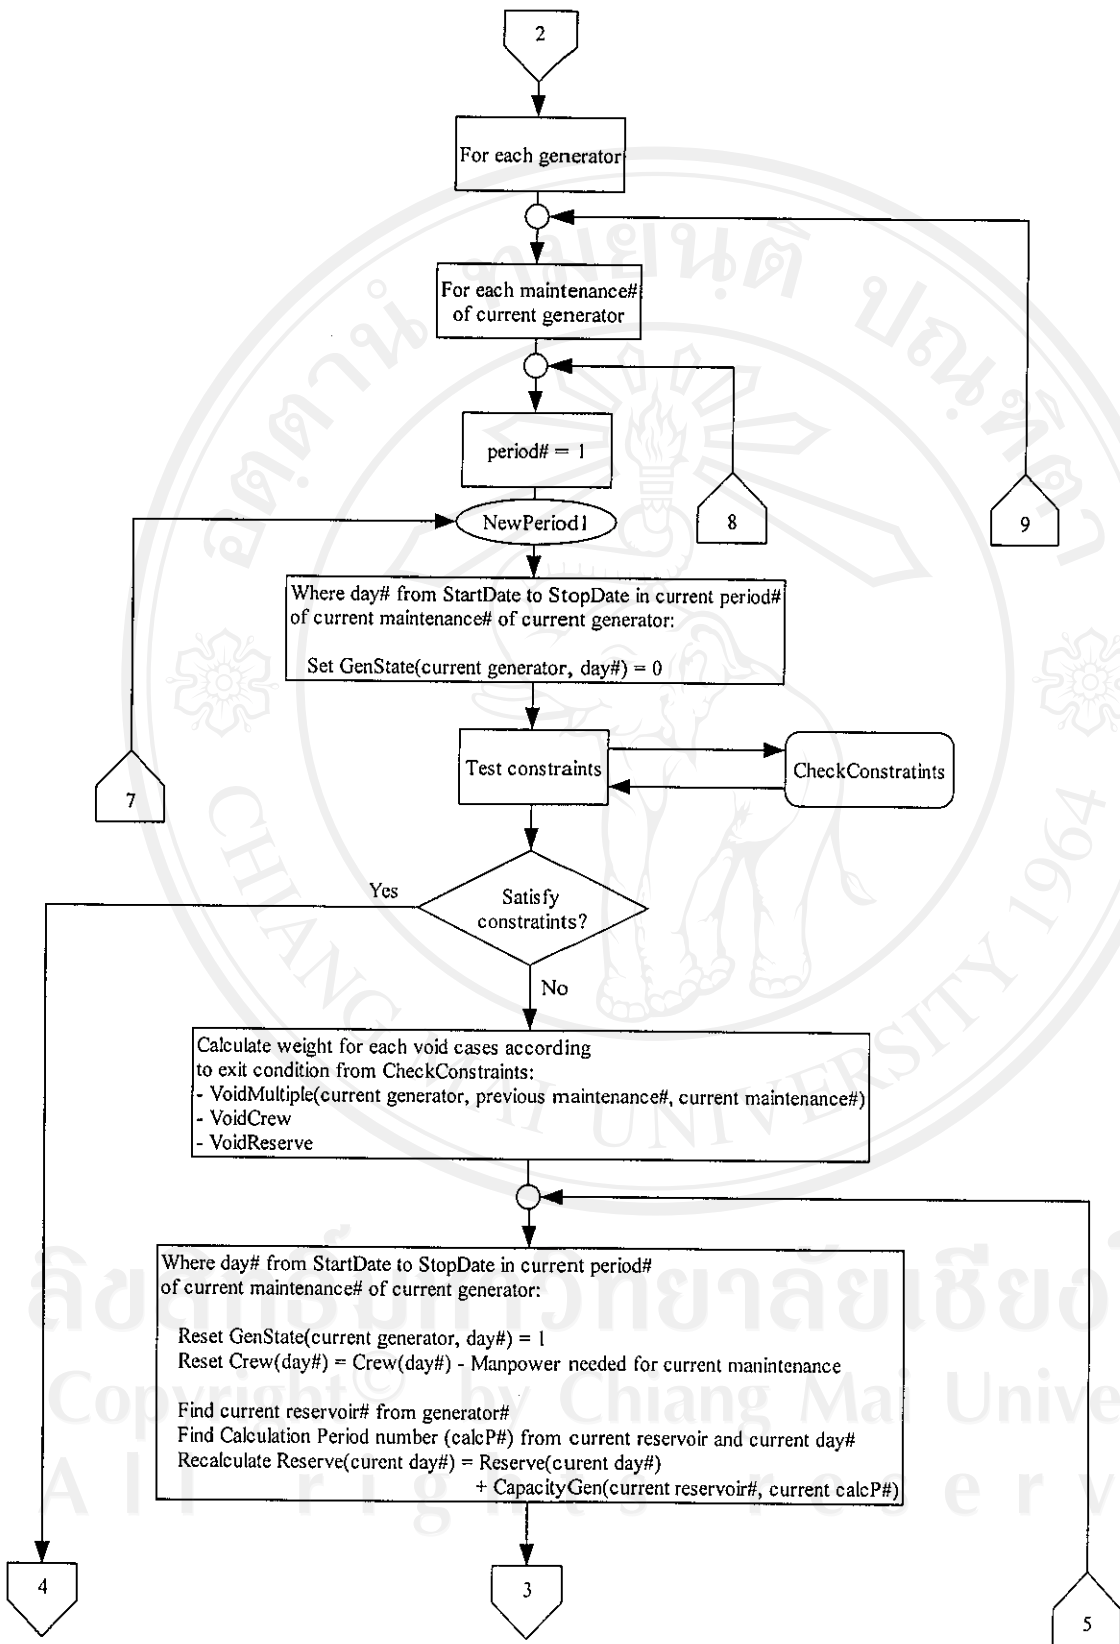

- GenState(generator#, day#)
- GenOutage(generator#, maintenance#, day#)
- ProductState(generator#, hour#)
- WaterRelease(reservoir#, month#)
- SpillWater(month#)

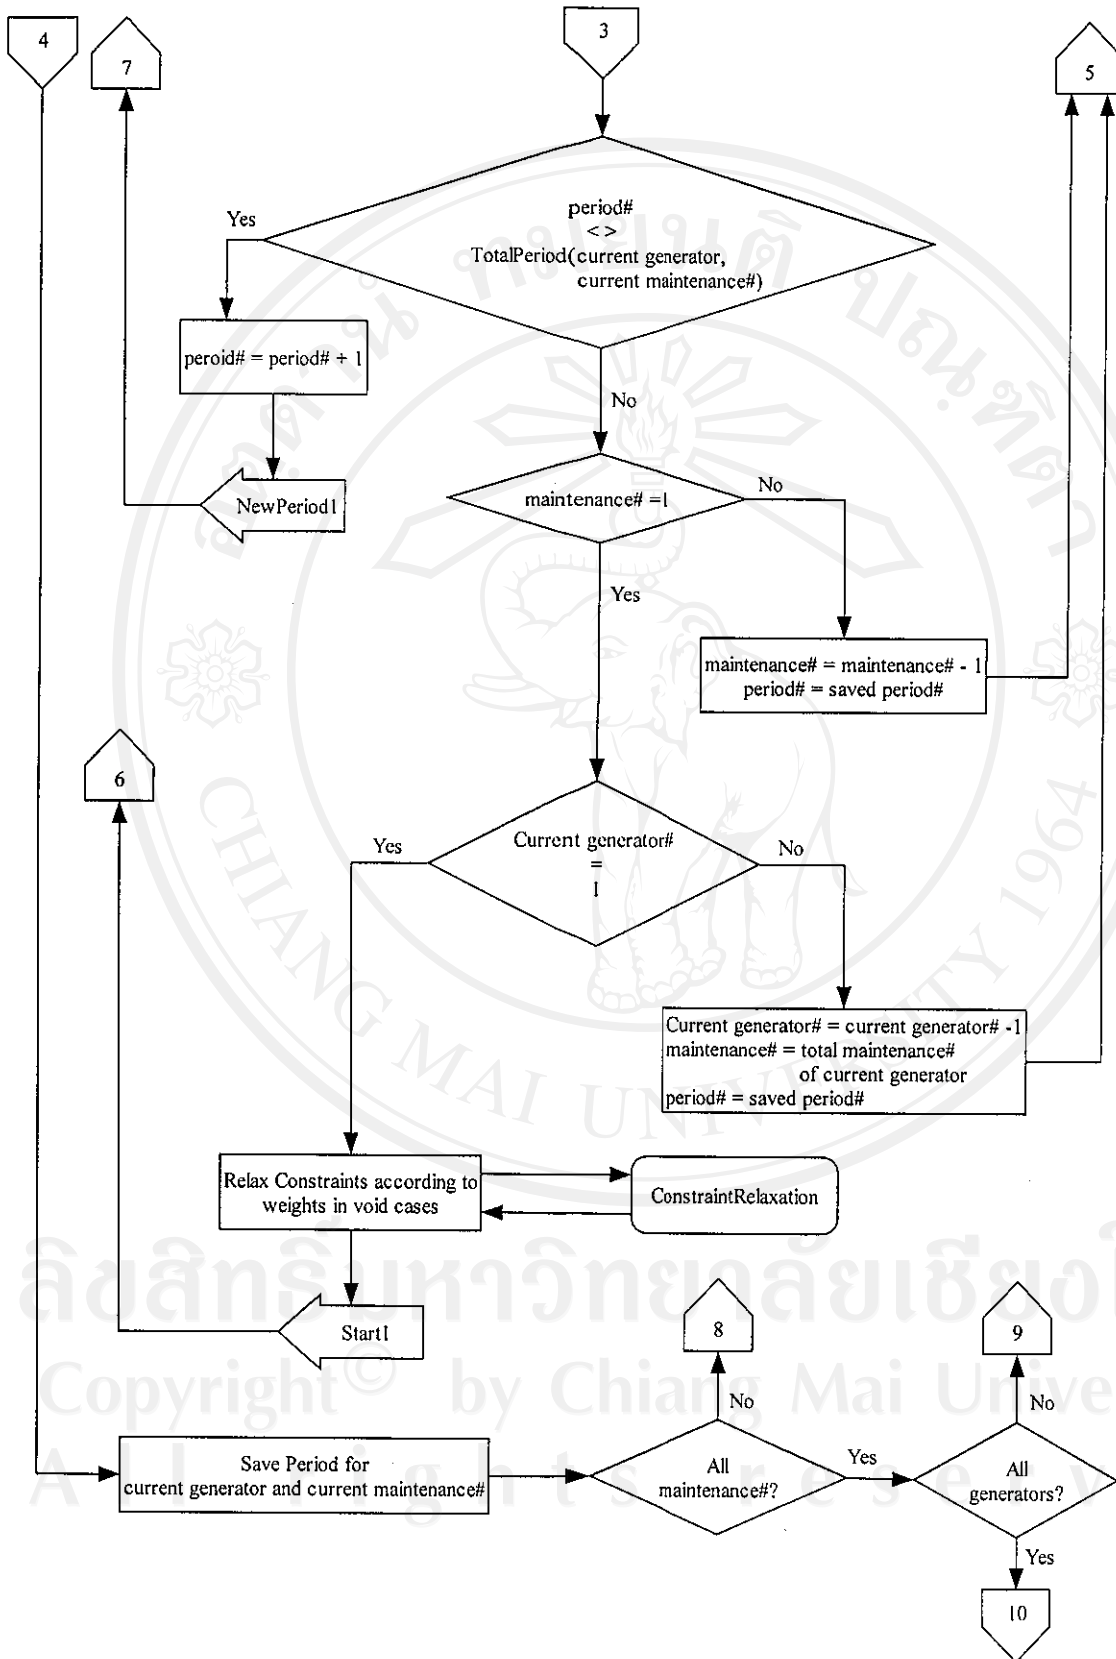

LocalVariable:

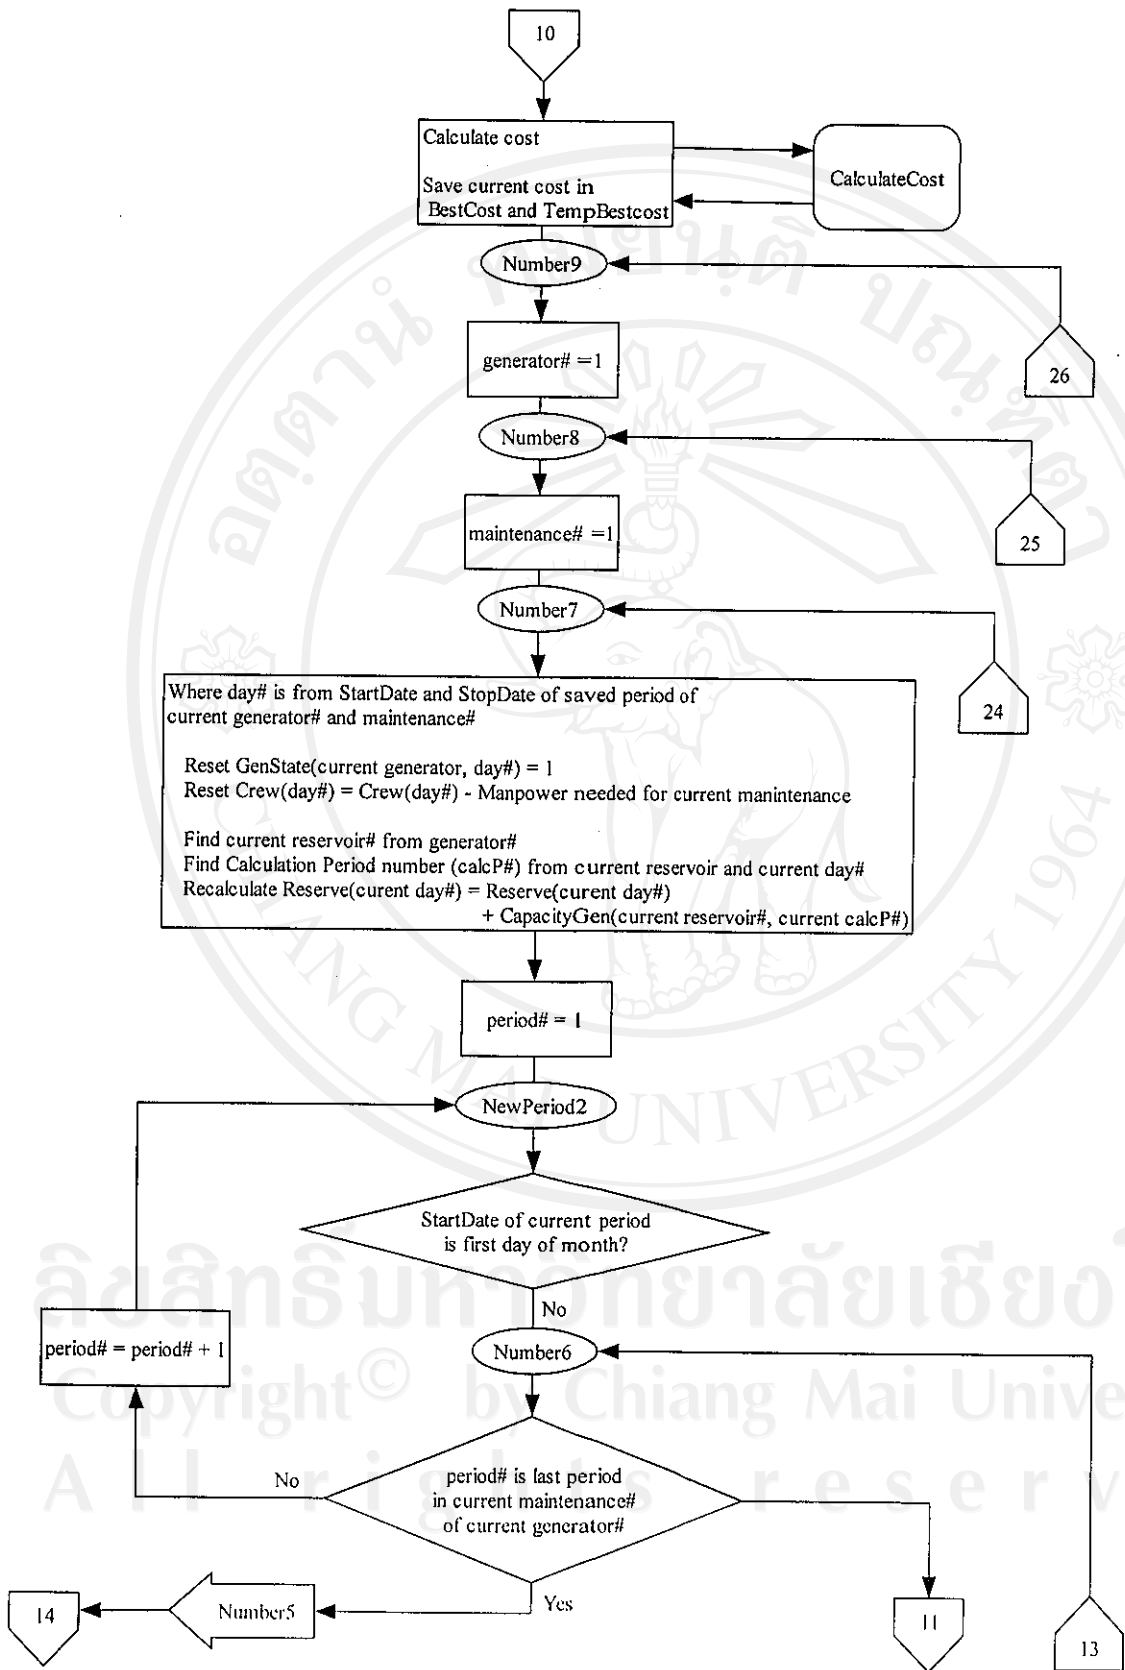

- TotalPeriod(generator#, maintenance#)
- VoidMultiple(generator#, maintenance# - 1, maintenance#)
- VoidCrew
- VoidReserve
- Crew
- Reserve
- MinReserve

Where day# from StartDate to StopDate in current period#
of current maintenance# of current generator:

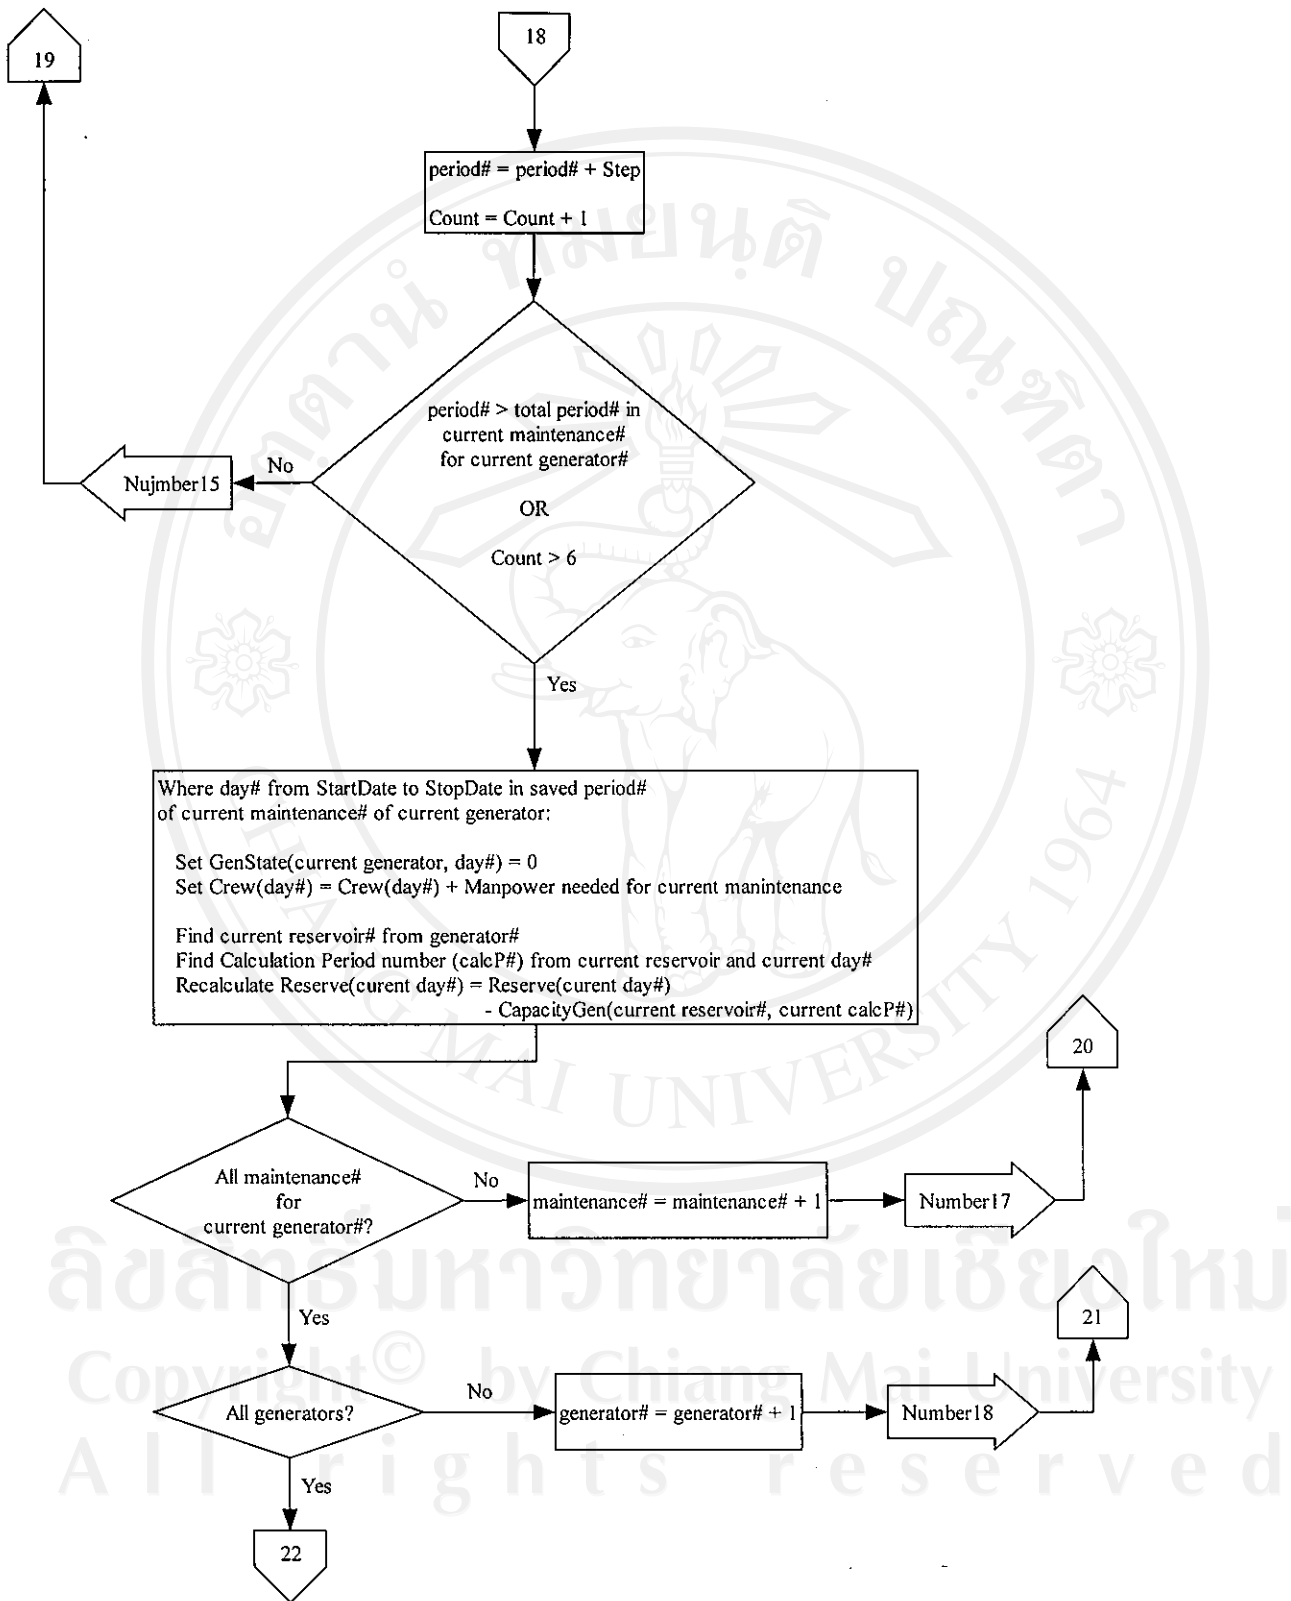

Reset GenState(current generator, day#) = 1
Reset Crew(day#) = Crew(day#) - Manpower needed for current manintenance

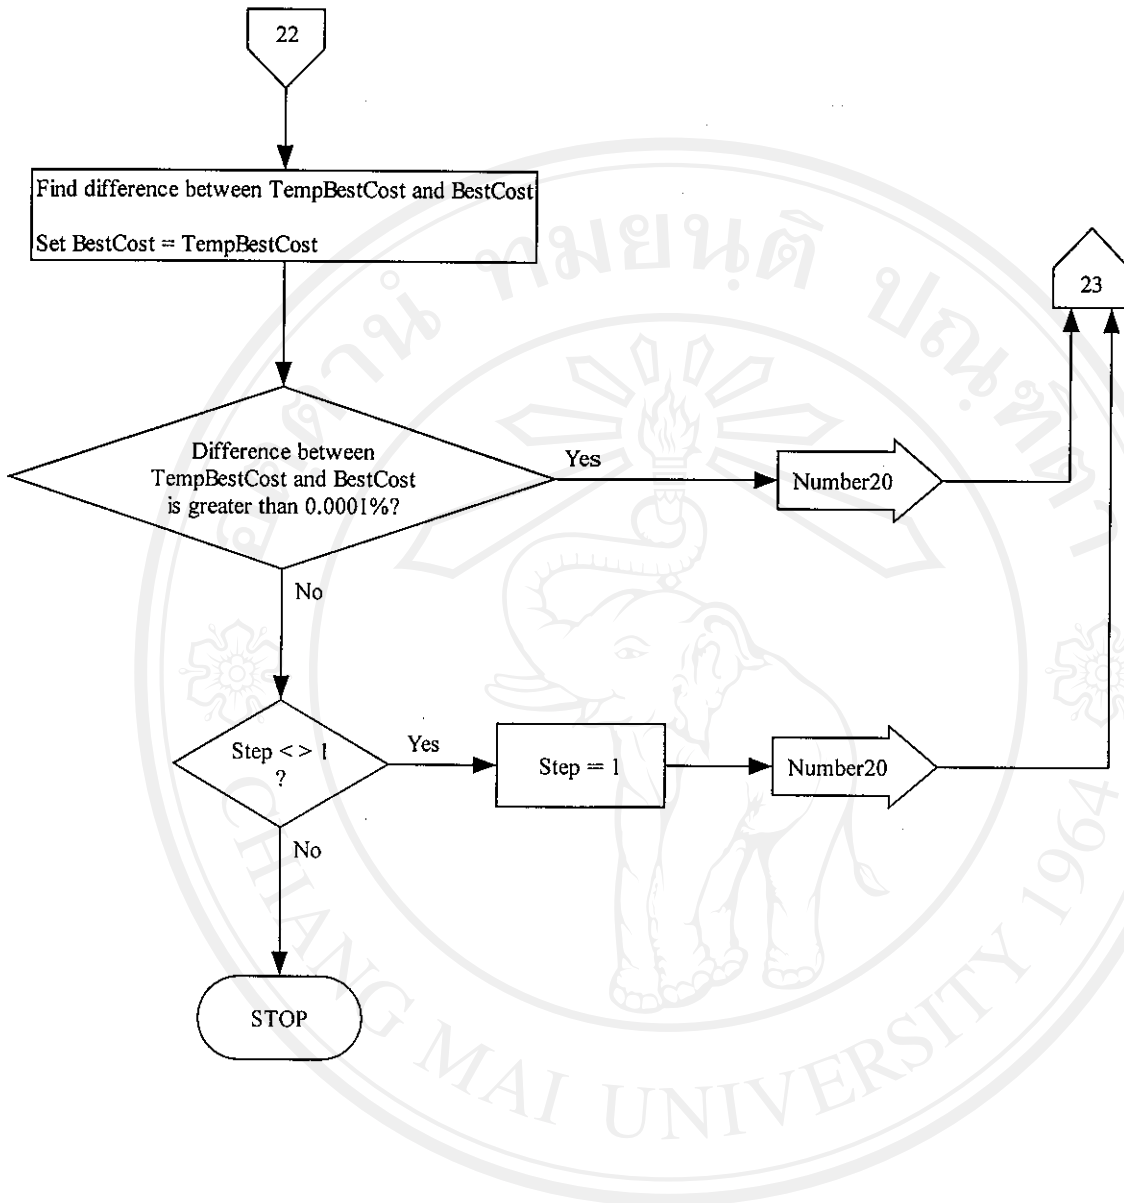

Find current reservoir# from generator#

Find Calculation Period number (calcP#) from current reservoir and current day#

Recalculate Reserve(curent day#) = Reserve(curent day#)
+ CapacityGen(current reservoir#, current calcP#)

18

A.6 Calculate Cost

Input:

- DataGeneral
- Generator(generator#)
- Reservoir(reservoir#)
- ImportTariffData
- ExportTariffData
- LoadForecast(day#, hour#)
- LoadPeak(day#)
- MaintenanceInfo(generator#)
- InflowForecast(reservoir#)
- MaxLimit(reservoir#, month#)
- MinLimit(reservoir#, month#)
- Average(reservoir#, month#)
- CalcPeriod(reservoir#, month#)
- TotalCalcPeriod(reservoir#)
- Release(reservoir#, month#)
- CapacityGen(generator#, calcP#)
- WaterRate(generator#, month#)
- Flow(hour#)
- LoadTemp(hour#)

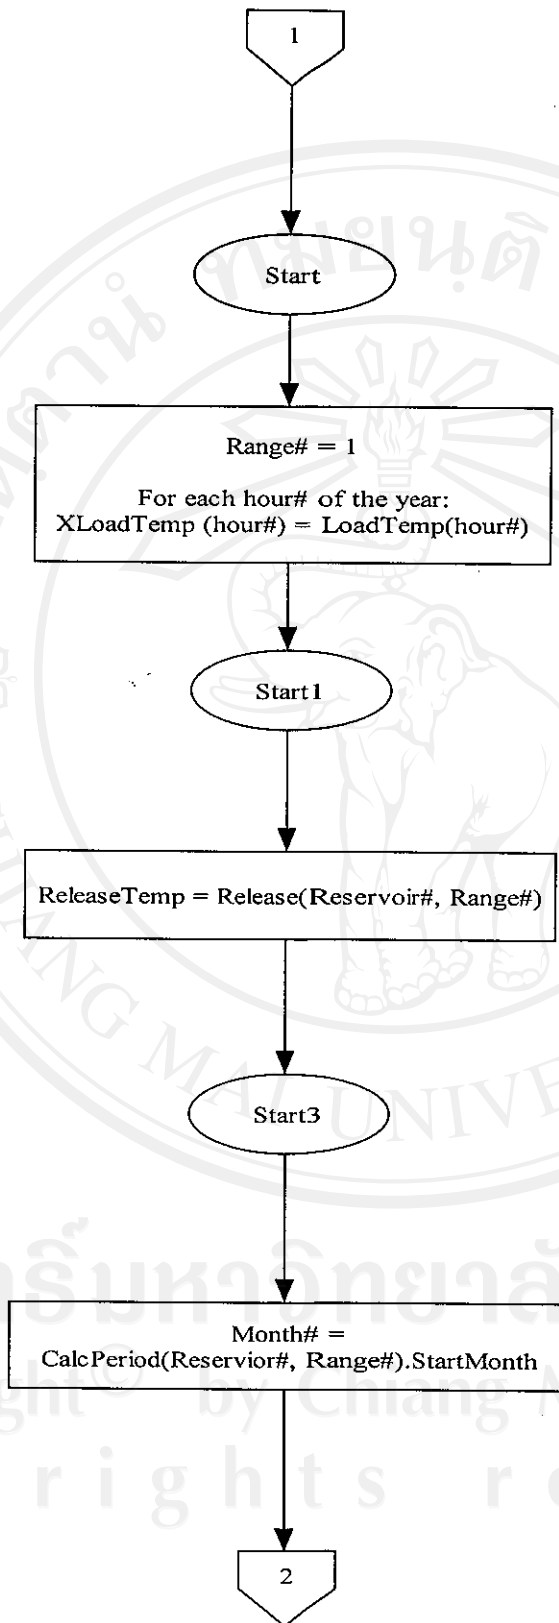

Output:

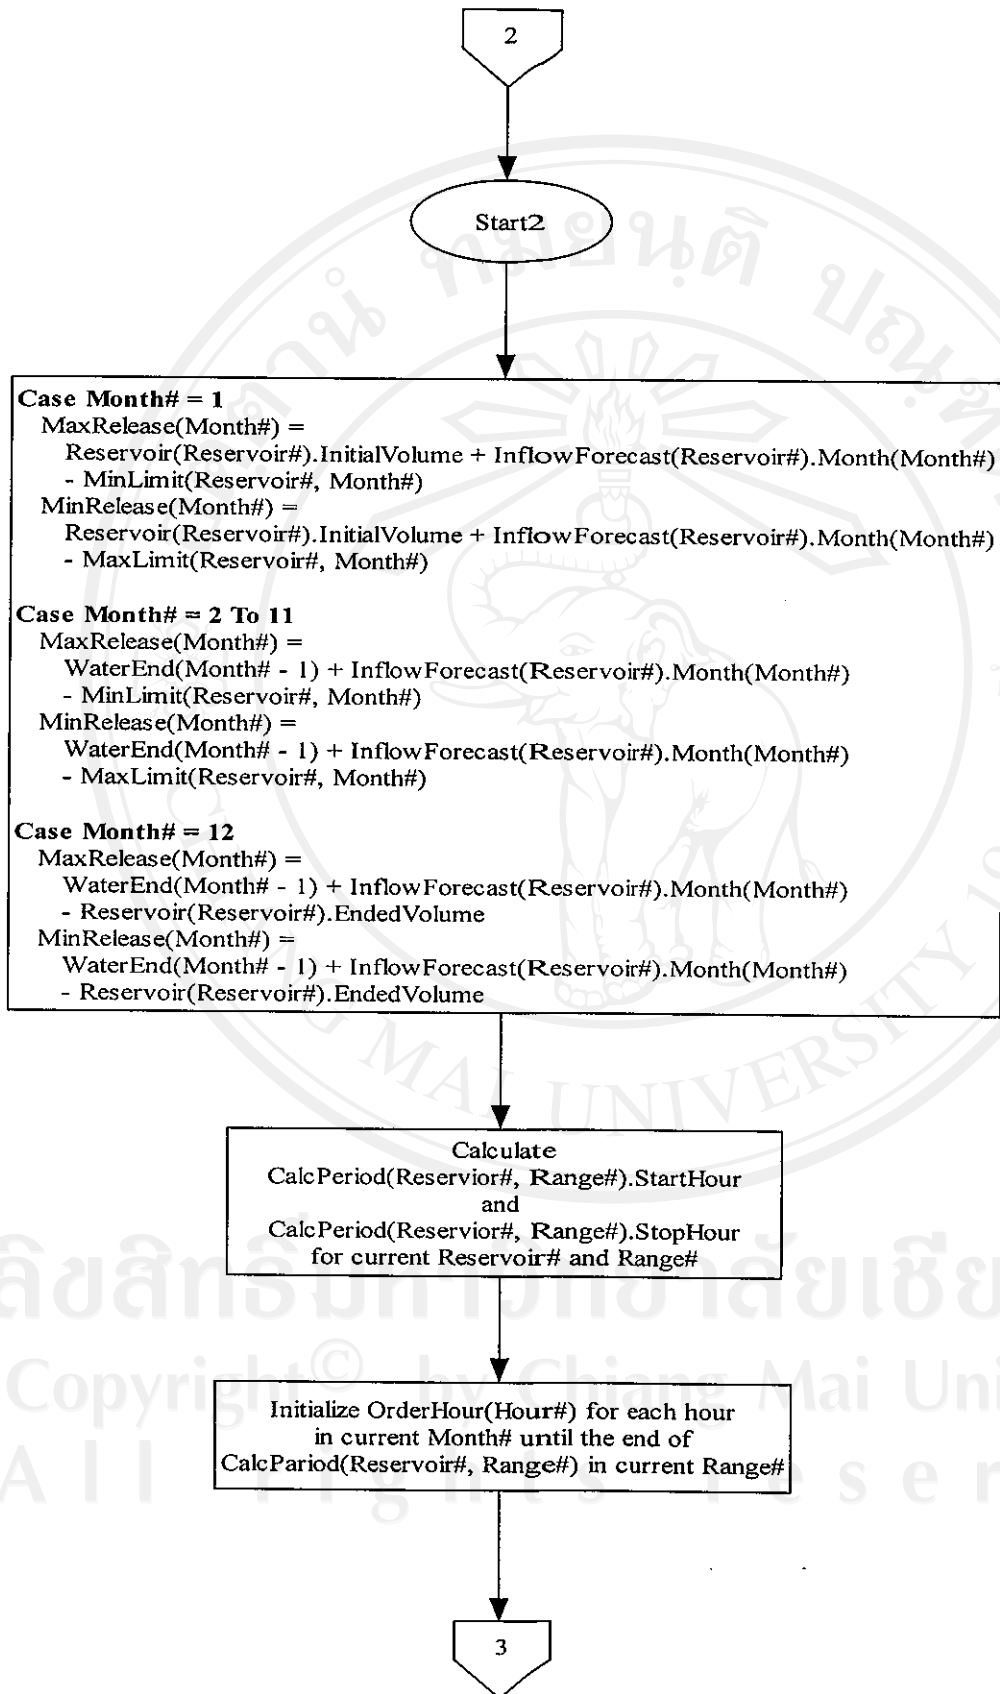

- Revenue

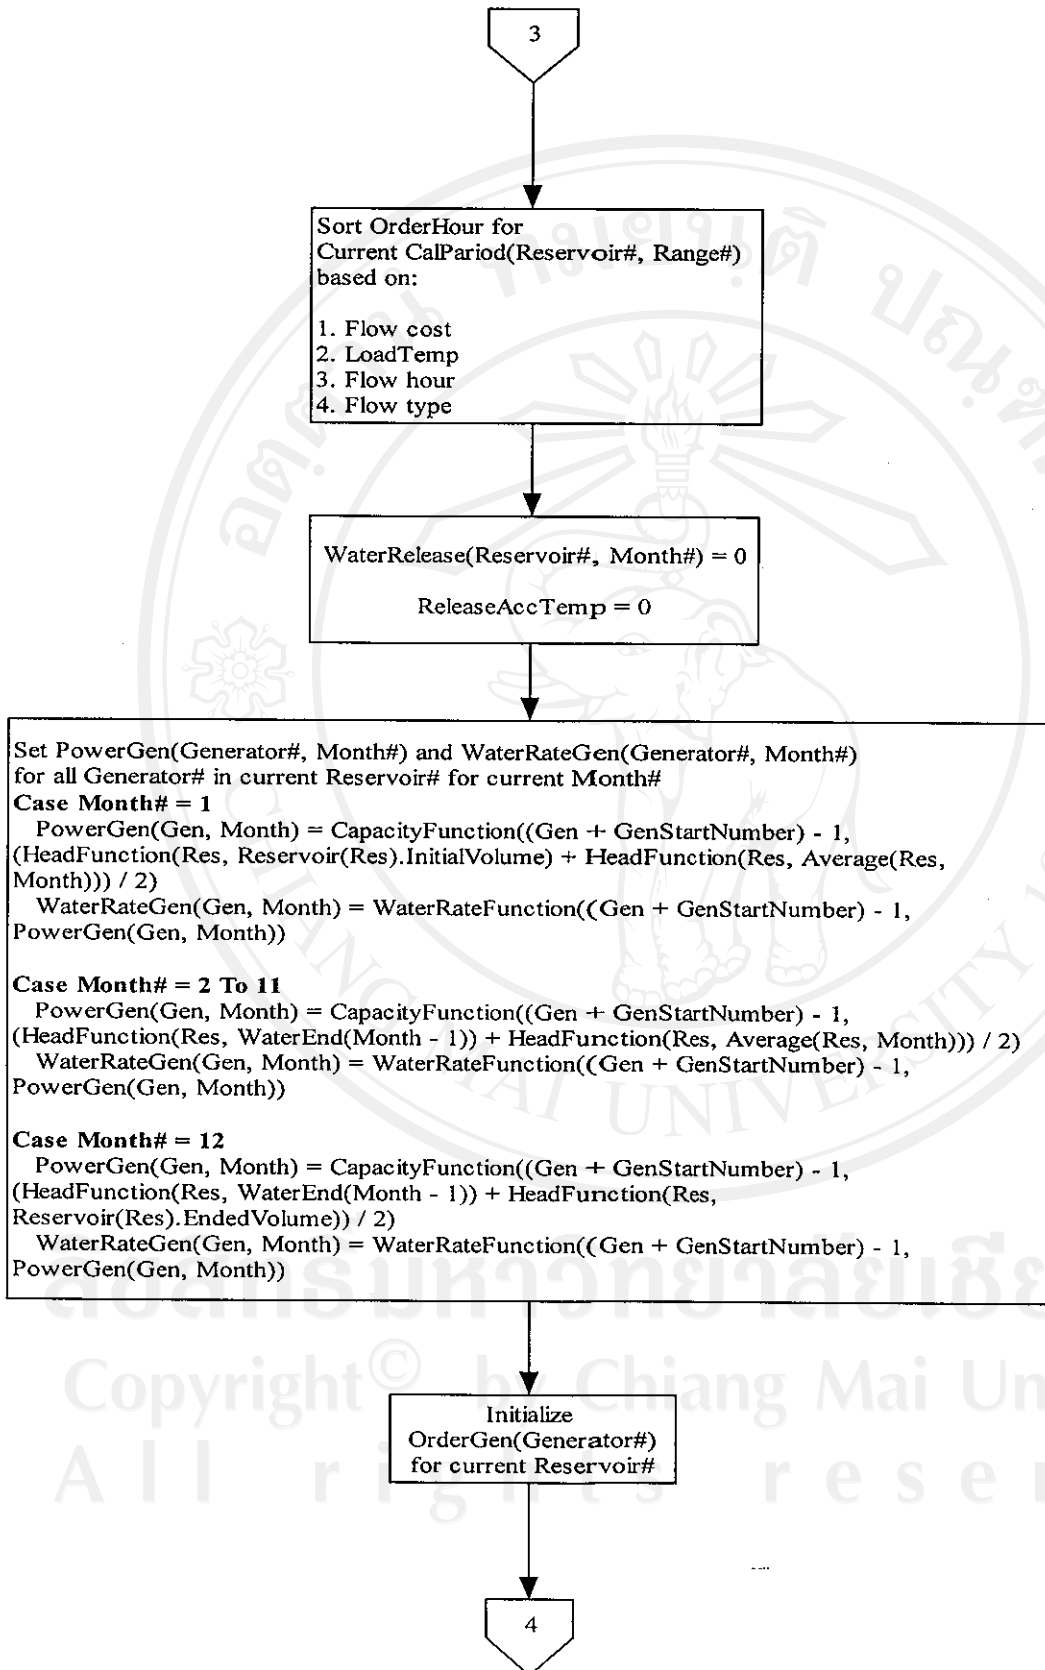

LocalVariable:

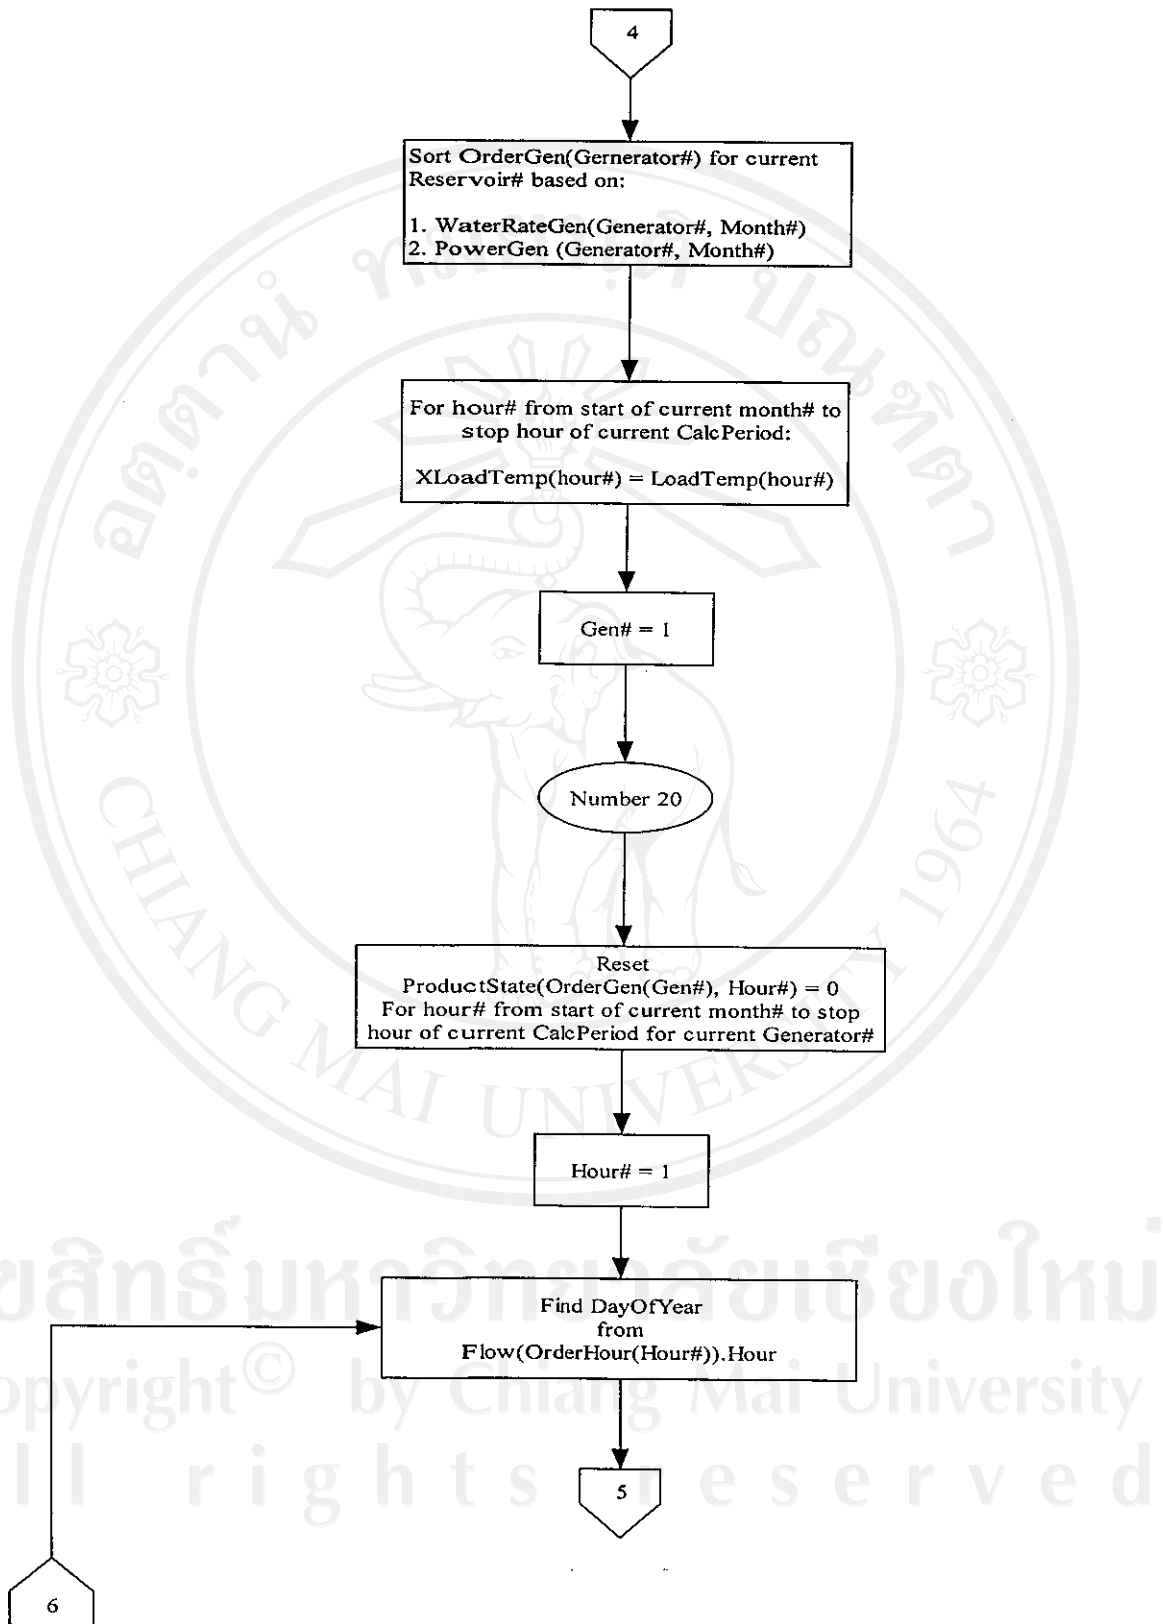

- SellPrice(hour#)
- BuyPrice(hour#)
- XLoadTemp(hour#)
- XLoadTemp1(hour#)
- ReleaseAcc(1 To 3, 1 To 12)
- ReleaseAccTemp
- ReleaseTemp
- MaxRelease(month#)
- MinRelease(month#)
- WaterEnd(month#)
- OrderHour(hour#)
- OrderHour1(hour#)
- OrderGen(1 To 10)
- PowerGen()
- WaterRateGen()
- Revenue
- Spacing
- SpillTemp As Double

Appendix B
Inflow Probability and Daily Load Profile

The Appendix B is divided into two appendixes B 1 and B2. The B 1 appendix is inflow probability of the Hydro power Plant reservoir which is already included in the Chapter 4 by making into graphs. The B 2 appendix is Daily Load profile for the whole year (12 months) this appendix is also included in the Chapter 4 by making into graphs too. The two Appendixes are shown into tables as below.
