CHAPTER I INTRODUCTION	**1**
1.1 Overview and Background	1
1.2 Flow Injection Analysis (FIA)	3
1.2.1 Introduction	3
1.2.2 Principle and Theory	5
1.2.3 Dispersion	7
1.2.4 Reverse Flow Injection Analysis	11
1.2.5 FIA Instrumentations	11
1.2.6 Application of FIA for Pharmaceutical Analysis	13
1.2.6.1 FI Methods Based on Direct UV Detection	15
1.2.6.2 FI Methods Based on Metals–Drugs Interactions	16
1.2.6.3 FI Methods Based on Various Color-Forming Reactions	18
1.3 Sequential Injection Analysis (SIA)	20

1.3.1 Introduction 20

1.3.2 Principle of SIA 20

1.3.3 Applications of SIA to Pharmaceutical Assays Analysis 27

1.4 Surfactant and Micelle 29

1.4.1 Introduction 29

1.4.2 Classification 35

1.4.2.1 Anionic Surfactant 35

1.4.2.2 Cationic Surfactant 36

1.4.2.3 Nonionic Surfactant 37

1.4.2.4 Zwitterionic surfactant 38

1.4.3 Micelles 38

1.5 Micellar Liquid Chromatography 40

1.5.1 Introduction 40

1.5.2 Chromatographic Behavior 42

1.5.3 The Three-Phase Model 44

1.5.4 Micellar Liquid Chromatography in Pharmaceutical Analysis 46

1.6 Zinc 48

1.6.1 Uses 48

1.6.2 Deficiency 50

1.6.3 Toxicity 51

1.6.4 Determination of Zinc in Pharmaceutical Preparations 53

LIST OF TABLES

Table		Page
1.1	FI methods utilizing various colour-forming reactions	17
1.2	FI methods utilizing various colour- forming reaction	21
1.3	Applications of SIA to pharmaceutical assays analysis	30
1.4	Application of MLC in pharmaceutical analysis	49
1.5	Comparison of reagents for the spectrophotometric determination of zinc	54
1.6	Analytical characteristics of some methods for the determination of tetracycline, chlortetracycline and oxytetracycline	56
1.7	Determination of active ingredients in cold preparations	63
2.1	Experimental protocol as shown in the FIAlab for Windows software	74
3.1	Effect of type of manifold on peak height.	81
3.2	Preliminary conditions before optimization of the rFI systems	84
3.3	Effect of varying wavelengths on analytical signal of CTC from rFI system	86
3.4	Effect of varying pH on analytical signal of CTC from rFI system	87
3.5	Effect of yttrium concentration on analytical signal of CTC from rFI system	89
3.6	Effect of varying CTAB concentration on sensitivity for CTC determination	91
3.7	Effect of varying mixing coil length on sensitivity for CTC determination	92

3.8	Effect of flow rate on sensitivity for CTC determination	94
3.9	Effect of injection volume	95
3.10	Univariate optimization of chemical and FIA conditions	96
3.11	The results of the initial simplex optimization for CTC determination	98
3.12	The summarization of the initial simplex optimization	99
3.13	The summarization of the second simplex optimization	99
3.14	The summarization of the third simplex optimization	100
3.15	The summarization of all simplex optimization of chemical and FI variables for chlortetracycline determination	101
3.16	Peak height for calibration curve	102
3.17	The recoveries of the added CTC with varying concentrations in sample solution (n=5)	104
3.18	Repeatability and reproducibility of replicate determination of CTC	105
3.19	Recoveries 2.0×10^{-5} mol l^{-1} CTC in solution of some excipients (n=5)	106
3.20	Results obtained from CTC determination in commercial pharmaceutical preparations by the proposed method and reference procedure	110
3.21	The determination of zinc by spectrophotometry by complexing with chromatic reagent in micellar media	113
3.22	Preliminary conditions before optimization of the rFI systems	114
3.23	The influence of wave length on peak heights and precision	116
3.24	Influence of pH on peak heights and precision	118

Table		Page
3.39	Tolerance limits of interferences ions on the determination of 1 μg ml^{-1} zinc(II) at optimum conditions	142
3.40	Determination of zinc(II) in pharmaceutical preparations sample with the propose SIA method and flame atomic absorption spectrophotometric method	143
3.41	Structures, dissociation constants and octanol-water partition constants of acetaminophen, guaifenesin, phenylephrine, pseudoephedrine and phenylpropanolamine	145
3.42	Comparison of peak area between the wave length of 210 and 254 nm	147
3.43	Effect of concentration of SDS	149
3.44	Effect of concentration pentanol	151
3.45	Effect of Flow rate	152
3.46	Characteristic parameters of the calibration equations, LODs and LOQs for the proposed method for simultaneous determination of five drugs.	156
3.47	Intra – day repeatability for the five drugs (% RSD, n = 10)	160
3.48	Inter – day repeatability for the five drugs (% RSD, n = 10)	160
3.49	Accuracy results for five drugs analysis by MLC	162
3.50	Comparative analysis of pharmaceuticals with micellar and aqueous–organic reversed-phase liquid chromatography	164

LIST OF ILLUSTRATIONS

Figure		Page
1.1	The basic components of the FIA system; P = pump, C = carrier stream, R = reagent stream, S = injection port, M = mixing reactor, D = detector, W = waste	6
1.2	The analog output has the form of a FIA peak, the recording starting at S (time of injection), H is the peak height, W is the peak width at a selected level, A is a peak area, T is the residence time corresponding to the peak height measurement and t_b is the peak width at the base line.	6
1.3	General types of transport in closed tubes and the recorded profiles at the detector.	7
1.4	Effects of convection and diffusion on concentration profiles of analyses at the detector: (a) no dispersion; (b) dispersion by convective process; (c) dispersion by convective process and radical diffusion; (d) dispersion by diffusion.	8
1.5	Dispersed sample zone in flow system; an original homogeneous sample zone (top left) disperses during its movement through a tubular reactor (top center), thus changing from an original square profile (bottom left) of original concentration C^0 to a continuous concentration gradient with maximum concentration C_{max} at the apex of the peak.	9

Figure		Page
1.6	Scheme of a peristaltic pump. A flexible tube is placed between the rotating head and a fixed piece. The rollers are squeezed onto the tubing.	12
1.7	The comparison of FIA and SIA	22
1.8	Dispersion in FIA and SIA	24
1.9	The schematic representation of a surfactant molecule	35
1.10	The molecular structure of alkyl phosphate, alkyl sulfonate, and alkyl benzene sulfonate.	36
1.11	The molecular structure of fatty amine salts which were the first style of cationic surfactant synthesized	36
1.12	The molecular structure of an alcohol ethoxylate and an alkylphenol ethoxylate	37
1.13	Three zwitterionic surfactants : an ammonium carboxylate, an ammonium sulfate and an amine oxide	38
1.14	The aggregation of N monomers to form a normal, aqueous micelle, the open circles represent polar head groups and may be anionic, cationic, nonionic or zwitterionic	39
1.15	Solute-micelle and solute-stationary phase interaction in micellar mobile phases	42
1.16	Solute – micelle and solute – stationary phase hydrophobic (🡅) and electrostatic interaction (⇧) with an anionic surfactant : (a) non polar solute, (b) anionic solute and (c) cationic solute	47
1.17	Structures of tetracycline and its derivatives	57

Figure		Page
2.1	The rFI manifold designed for CTC determination by injection of the reagent solution into the merging stream of the buffer and sample/standard solution	71
2.2	SI manifold for the determination of zinc(II) : A (valve 1), a combined buffer solution and masking agent ; B(valve 2), Triton X – 100 ; C(valve 3), sample ; D(valve 4), PAN solution ; E(valve 5) water and 150 cm /0.7 mm (length/i.d.) holding coil	73
3.1	The 2 type of rFI manifolds designed for CTC determination (A) injection of the yttrium (III) as reagent solution into the buffer stream before merging with the sample/standard solution (B) injection of the reagent solution into the merging stream of the buffer and sample/standard solution. (Y = Y connector, I = home-made injection valve.	82
3.2	The absorption spectra of CTC (A), CTC-yttrium(III) complex (B) and CTC-yttrium(III) complex in CTAB medium (C)	83
3.3	Lanthanide – tetracycline complex	85
3.4	Effect of varying wavelengths on sensitivity for CTC determination	86
3.5	Effect of varying pH on sensitivity for CTC determination	88
3.6	Effect of varying yttrium(III) concentration on sensitivity for CTC determination	89

Figure		Page
3.7	Effect of varying CTAB concentration on sensitivity for CTC determination	91
3.8	Effect of varying mixing coil length on sensitivity for CTC determination	93
3.9	Effect of flow rate on sensitivity for CTC determination	94
3.10	Effect of varying injection volume on sensitivity for CTC determination	96
3.11	Sensitivity vs. experiment number for simplex method	100
3.12	The FIA-gram of standard CTC solutions	103
3.13	Calibration curve for CTC determination	103
3.14	Absorption spectra of zinc complex and its reagent blank curve. (A) PAN – Triton X – 100, (B) zinc– PAN – Triton X –100. The concentration of zinc = 5 μg ml^{-1} , PAN = 1.0 × 10^{-4} mol l^{-1}, and Triton X – 100 = 1%, respectively ; in carbonate buffer solution pH = 9.0	115
3.15	Influence of wave length on peak heights and precision	116
3.16	Influence of pH on peak heights and precision	118
3.17	Influence of the aspiration order designed on the peak heights and precision	121
3.18	Influence of flow rate of aspiration of sample on peak heights and precision	122
3.19	Influence of flow rate of aspiration of reagent on peak heights and precision	123
3.20	Influence of flow rate of sending sample to detector	125
3.21	Influence of aspiration volume of buffer on peak heights and precision	127
3.22	Influence of aspiration volume of Triton – X 100r on peak heights and precision	128

Figure		Page
3.23	Influence of aspiration volume of standard/sample on the peak heights and precision	129
3.24	Influence of aspiration volume of PAN on the peak heights and precision	131
3.25	Influence of PAN concentration on peak heights and precision	132
3.26	Influence of Triton X – 100 concentration of peak heights and precision	134
3.27	The curve showing the linear range for zinc(II) determination	136
3.28	SIA gram for zinc(II) determination	137
3.29	Calibration curve for zinc(II) determination	138
3.30	SIA gram for 0.5 μg ml^{-1}	139
3.31	Effect of pH on the retention acetaminophen (AC), guaifenesin(GUA), phenylephrine(PE), pseudoephedrine(PSUED) and phenylpropanolamine(PP). Micellar mobile phase: 0.150 mol l^{-1} SDS, 2% v/v pentanol	154
3.32	Calibration curve for acetaminophen	157
3.33	Calibration curve for guaifenesin	157
3.34	Calibration curve for phenylephrine	158
3.35	Calibration curve for pseudoephedrine	158
3.36	Calibration curve for phenylpropanolamine	159
3.37	Stability study at room temperature of 20 μg ml-1 five drugs	161
3.38	Chromatograms of some pharmaceutical preparations	166

ABBREVIATIONS AND SYMBOLS

AU	absorbance unit
b	pathlength
CTC	chlortetracycline
FIA	flow injection analysis
h	hour
i.d.	inner diameter
in.	inch
l	liter
LOD	limit of detection
LOQ	limit of quantitation
mg	milligram
min	minute
ml	milliliter
mm	millimeter
mV	millivolt
nm	nanometer
o.d.	outer diameter
PDMS	poly(dimethylsiloxane)
PTFE	polytetrafluoroethylene
RSD	relative standard deviation
SD	standard deviation
sec	second
SIA	sequential injection analysis
v/v	volume by volume
µg	microgram
µl	microliter
