ACKNOWLEDGEMENTS

First, I would like to deeply thank the various people who, during the education in which this endeavor lasted, provided me with useful and helpful assistance. I would like to express my deep appreciation and sincere gratitude to Professor Dr. Kate Grudpan, my advisor, who has supported me throughout my thesis with his patience and knowledge whilst allowing me the room to work in my own way. I attribute the level of my Masters degree to his encouragement and effort and without him this thesis, too, would not have been completed or written.

Second, I would like to thank Assistant Professor Dr. Somchai Lapanantnoppakhun for his unwavering support and continuous valuable guidance throughout the study and research. I am also deeply grateful to Associate Professor Dr. Supaporn Kradtap Hartwell of the Department of Chemistry, Faculty of Science, Chiang Mai University and Assistant Professor Dr. Yuthasuk Vaneesorn my committee member, for their worthy comments and suggestions.

Third, I would like to express gratitude to the Center for Innovation in Chemistry: Postgraduate Education and Research Program in Chemistry (PERCH-CIC) for postgraduate scholarship and research financial support. Thailand Research Fund and the Graduate School Chiang Mai University are also recognized.

Finally, I thank Mr. Wasin Wongwilai, all my seniors and juniors at Flow Based Analysis Group and my family for their shares of the successes of this work.
