## APPENDIX D

### Iodometric Method for the Determination of Ozone in a process gas

(International Ozone Association, Quality Assurance Committee, Revised Standardized Procedure 001/96.)

Object : The present standard method concerns the determination of ozone in air, oxygen or other process gases.

#### Reagents

1. Quality of the water for make-up of solutions shall comply with ISO No.3696-1987 Grade 1).
2. Buffered KI (potassium iodide) in water
3. Buffered KI (potassium iodide) in water: KI 20 g/L;Na<sub>2</sub>HPO<sub>4</sub>.2H<sub>2</sub>O (disodium hydrogen phosphate) 7.3 g/L and KH<sub>2</sub>PO<sub>4</sub> (monopotassium dihydrogen phosphate) 3.5g/L.
4. Sodium thiosulfate:Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> 0.1 mol/L in water.
5. Acidifying solution: H<sub>2</sub>SO<sub>4</sub> (sulfuric acid):4.5 mol/L
6. Powered KIO<sub>3</sub> (Potassium periodate).
7. Cystalline KI.
8. HCl (hydrochloric acid) or H<sub>2</sub>SO<sub>4</sub> 0.1 N.
9. Starch indicator: ZnI<sub>2</sub> (zinc iodide)-starch, prepared by dispersing 4 g starch into an aliquot of water. The dispersion is added to a solution of 20 g ZnCl<sub>2</sub> (zinc chloride) in 100ml water. The solution is boiled until the volume has been reduced to 100mL and is finally diluted to 1-Lwhile adding 2 g of ZnI<sub>2</sub>. The indicator is stable for at least one month when stored in the dark at room temperature.

## Standardization of titrant.

### 1. Principle

### 2. Procedure

2.1 To 50mL of water in a 250 conical flask are added 0.05 g  $\text{KIO}_3$  and 0.5 g  $\text{KI}$ , followed by another volume of about 50mL water. After mixing, 10 ml of certified 0.1 N acid are added. The iodine formed is titrated with the thiosulfate solution. Normality of  $\text{S}_2\text{O}_3^{2-}$  equals: Normality of acid multiplied by the volume of acid (ml) and divided by the volume of thiosulfate titrant (ml).

#### 2.2 Determination of ozone.

2.1 200ml of  $\text{KI}$  solution are added to a gas washing bottle equipped with an open gas bubbling device (tube or diffusor) under a reagent depth of 15 cm or more; (the use of fritted glass diffusors is not recommended).

2.2 A second identical flask is connected in series as a guard detector for ozone transfer and reaction in the first flask.

2.3 Process gas containing ozone is bubbled at a flow rate of 1 l/min or less, until a total (estimated or expected) quantity of approximately 1 mM  $\text{O}_3$  (it equals 0.048 g) has passed.

2.4 The iodine formed in the solutions of  $\text{KI}$  in the flasks, immediately after acidification with 5ml of the acidifying reagent, is titrated with a freshly standardized sodium thiosulfate solution.

2.5 After titration to a pale yellow color, optionally, 0.5mL of the starch indicator solution can be added to complete and record the final result.

2.6 Concentration of ozone in g/L equals:  $24 \times$  volume of thiosulfate in L  $\times$  Normality of thiosulfate divided by the inlet volume of gas passed in L.
