

Motivation and Self-Regulation in Sport and Exercise

Edited by Chris Englert and Ian M. Taylor

CONTENTS

<i>List of Figures</i>	<i>vii</i>
<i>List of Tables</i>	<i>ix</i>
<i>List of Contributors</i>	<i>xi</i>
1 Introduction to Motivation and Self-Regulation in Sport and Exercise <i>Chris Englert and Ian M. Taylor</i>	1
2 Enacting Physical Activity Intention: A Multi-Process Action Control Approach <i>Ryan E. Rhodes, Henry La, Alison Quinlan, and Stina Grant</i>	8
3 Exercise Motivation from a Post-cognitivist Perspective: Affective-Reflective Theory <i>Panteleimon Ekkekakis and Ralf Brand</i>	20
4 Heuristics, Biases, and Bounded Rationality: A Dual-Process and Behavioral-Science Approach to Exercise Initiation and Maintenance <i>Zachary Zenko, Catherine J. Berman, and Julia D. O'Brien</i>	41
5 Body-Related Self-Conscious Emotions in Sport and Exercise: A Self-Regulation Perspective <i>Catherine M. Sabiston, Madison F. Vani, and Ross M. Murray</i>	62
6 Perfectionism Myths <i>Andrew P. Hill</i>	78

7	A Motivational Model of Endurance and Persistence <i>Ian M. Taylor</i>	87
8	The Strength Model of Self-Control <i>Chris Englert</i>	102
9	Understanding and Interpreting the Effects of Prior Cognitive Exertion on Self-Regulation of Sport and Exercise Performance <i>Jeffrey D. Graham and Denver M. Y. Brown</i>	113
10	The Effects of Mental Fatigue on Sport Performance: An Update <i>Jeroen Van Cutsem and Samuele Marcora</i>	134
11	Neuroscientific Approaches to Self-Regulatory Control in Sports <i>Wanja Wolff, Anna Hirsch, Maik Bieleke, and Amitai Shenhav</i>	149
12	Planning and Implementation Intention Interventions in Physical Activity <i>Susette A. Moyers and Martin S. Hagger</i>	166
13	Summary, Common Themes, and Future Directions <i>Ian M. Taylor and Chris Englert</i>	184

FIGURES

2.1	Influences on physical activity intention-behavior discordance	11
2.2	Schematic explaining the effect of regulatory processes on action control	15
2.3	Schematic explaining the effect of reflexive processes on action control	16
5.1	Proposed associations between self-regulatory factors, body-related self-conscious emotions, and sport and exercise behavior	74
7.1	A motivation process model of endurance performance	95
9.1	Cognitive exertion – physical performance publication trends (1998–2020) across all disciplines ($N = 100$), based on the Brown et al. (2020) meta-analysis and an updated search to include literature from the earliest available date up to July 2020	115
9.2	Cognitive exertion – physical performance publication trends (1998–2018) for physiology ($N = 47$), sport and exercise psychology ($N = 36$), and psychology ($N = 17$), based on the Brown et al. (2020) meta-analysis and an updated search to include literature from the earliest available date up to July 2020	116
10.1	Overview of the impact of mental fatigue on sport performance and the underlying mechanisms (mediators)	139
11.1	The Expected Value of Control (EVC) theory. (a) The EVC theory predicts that dACC integrates information about relevant incentives and task demand to determine the overall EVC of potential control configurations. On the basis of this EVC calculation, the dACC specified the optimal (EVC-maximizing) set of control signals, and signals these to relevant downstream regions which guide the execution of these control signals. Adapted from Shenhav et al. (2016). (b) Within the EVC framework, increases in the expected difficulty of a task (bold vs. dashed lines) will often lead to the prediction that additional control is needed to achieve a given level of payoff (green curves). This expected payoff is discounted by the expected cost (red curves) of exerting the	

necessary mental effort (control intensity), determining the overall EVC of that control intensity (blue curves). The maximum of this EVC curve determines the optimal control setting (black arrows). Adapted from Shenhav et al. (2013)

154

11.2 Web of Science Search (per January 2020) on the publication trends for neuroscientific research in regard to sports. Panel (a) illustrates the broad increase in research into the sporting brain (search terms: Sports AND brain). Panel (b) only includes papers that additionally have the term “during” in their title, to illustrate the relative scarcity and the increase in research on brain activity while people do sports

158

11.3 fNIRS Setup: (a) Schematic illustration of NIR light pathway between emitter and detector, (b) illustration of fNIRS montage designed to capture oxygenation changes in the dorsolateral prefrontal cortex, and (c) illustration of the sensitivity profile for capturing specific regions based on the montage designed to capture changes in the dorsolateral prefrontal cortex
