<i>List of Figures</i>	x
<i>List of Tables</i>	xiii
<i>Preface</i>	xiv
<i>Acknowledgements</i>	xvii
1 Optimization in Energy Markets	1
1.1 Classification of optimization problems	1
1.1.1 Linear versus nonlinear problems	1
1.1.2 Deterministic versus stochastic problems	2
1.1.3 Static versus dynamic problems	2
1.2 Optimal portfolio selection among different investment alternatives	3
1.3 Energy asset optimization	7
1.3.1 Generation asset investment valuation with real option methodology	7
1.3.2 Generation, transportation and storage asset operational optimization and valuation	11
1.4 Energy trading and optimization	15
1.4.1 Asset allocation with capital constraints	17
1.4.2 Intraday trading	22
2 Optimization Methods	26
2.1 Linear optimization	26
2.1.1 LP problems	27
2.2 Nonlinear optimization	28
2.2.1 Unconstrained problem	28
2.2.2 Constrained problems with equality constraints	29
2.2.3 Constrained problems with inequalities constraints	30
2.3 Pricing financial assets	31
2.3.1 Pricing in energy markets	32
2.3.2 Pricing in incomplete markets	32
2.3.3 A motivating example: utility indifference pricing	33
2.4 Deterministic dynamic programming	35
2.5 Stochastic Dynamic Programming, discrete time	38
2.5.1 A motivating example	39

2.5.2	The general case	41
2.5.3	Tree methods	43
2.5.4	Least Square Monte Carlo methods	46
2.5.5	Naïve Monte Carlo with linear programming	47
2.6	Stochastic Dynamic Programming, continuous time	48
2.6.1	The Hamilton-Jacobi-Bellman equation	50
2.7	Deterministic numerical methods	55
2.7.1	Finite difference method for HJB equation	55
2.7.2	Boundary conditions	57
2.8	Probabilistic numerical methods	57
2.8.1	Tree methods, continuous time	59
2.8.2	Computationally simple trees in dimension 1	60
2.8.3	Lattice of trees	63
2.8.4	Monte Carlo methods	67
3	Cases on Static Optimization	69
3.1	Case A: investment alternatives	69
3.1.1	Investment Alternative A	69
3.1.2	Investment Alternative B	70
3.1.3	Investment Alternative C	70
3.2	Case B: Optimal generation mix for an electricity producer: a mean-variance approach	79
3.3	Conclusions	90
4	Valuing Project Flexibilities Using the Diagrammatic Approach	92
4.1	Introduction	92
4.2	Description of the investment problem	92
4.3	Traditional evaluation methods	94
4.4	Modelling electricity price dynamics	95
4.5	Valuing investment flexibilities by means of the lattice approach	96
4.5.1	Investment alternative A	99
4.5.2	Investment alternative B	99
4.5.3	Investment alternative C	101
4.6	Conclusions	101
5	Virtual Power Plant Contracts	105
5.1	Introduction	105
5.2	Valuation problem	106
5.2.1	Example	110
6	Algorithms Comparison: The Swing Case	114
6.1	Introduction	114
6.2	Swing contracts	115
6.2.1	Indexed strike price modelling for gas swing contracts	115

6.2.2	The stochastic control problem	119
6.2.3	Dynamic programming	121
6.3	Finite difference algorithm	122
6.3.1	Boundary conditions	124
6.3.2	The algorithm	126
6.4	Least Square Monte Carlo algorithm	128
6.4.1	The algorithm and a reduction to one dimension	129
6.5	Naïve Monte Carlo with linear programming	131
6.6	Numerical experiments	131
6.6.1	Finite differences	132
6.6.2	Least Square Monte Carlo	133
6.6.3	One-year contract	135
6.7	Conclusions	137
7	Storage Contracts	146
7.1	The contract	146
7.2	The evaluation problem	148
7.3	The optimal strategy (in the case of a physical gas storage)	149
7.4	The implementation	150
7.4.1	The gas cave	151
7.4.2	The gas spot price	153
7.4.3	The boundary conditions	154
7.4.4	Numerical experiment, no-penalty case	154
7.4.5	Numerical experiment, penalty case	157
8	Optimal Trading Strategies in Intraday Power Markets	161
8.1	Intraday power markets	161
8.1.1	Intraday power price features	162
8.1.2	Conclusions	169
8.2	Optimal algorithmic trading in auction-based intraday power markets	169
8.2.1	The optimization problem	170
8.2.2	Example: Italian intraday market	172
8.3	Optimal algorithmic trading in continuous time power markets	178
8.3.1	The optimization problem	179
8.3.2	Example: EPEX Spot market	181
	<i>Notes</i>	185
	<i>Index</i>	187

List of Figures

1.1	Decision alternatives and project's value probabilistic evolution of a simple investment project in a generic energy asset	11
1.2	Binomial tree for the price evolution	19
2.1	Example of convex polytope generated by problem (2.1)	28
2.2	Binomial tree for the underlying asset S_k , $k = 0, 1, 2$	45
2.3	Binomial tree for the value of an American call option C_k , $k = 0, 1, 2$	46
3.1	Investment Alternative A free cash flow	70
3.2	Investment Alternative B free cash flow	70
3.3	Investment Alternative C free cash flow	71
3.4	Cash flow simulations	72
3.5	Logical implementation scheme of the optimization problem	73
3.6	Optimal portfolio allocation	75
3.7	Expected IRR and standard deviations as functions of λ	76
3.8	Efficient frontier, 250M€ of invested capital	76
3.9	Minimum risk portfolio with min target expected IRR of 7.12%	77
3.10	Minimum risk portfolio with min target expected IRR of 9.31%	77
3.11	Minimum risk portfolio with min target expected IRR of 11.78%	78
3.12	Efficient frontier, 50M€ of invested capital	78
3.13	Electricity production by source	80
3.14	Normalized NPV interest rate 4%	86
3.15	Normalized NPV interest rate 8%	86
3.16	Efficient MV frontier	88
3.17	Efficient MV frontier for different levels of interest rates	89
3.18	Optimal portfolio's weights	89
3.19	Normalized NPV	90
3.20	Optimal portfolio's weights	90
4.1	Electricity Price trinomial tree	97
4.2	Evaluation diagram of investment alternative A	100
4.3	Evaluation diagram of investment alternative B	102
4.4	Evaluation diagram of investment alternative C	103
5.1	State transitions, given operational constraints	109
5.2	Flat hourly curves used for the intrinsic valuation	111
5.3	Energy and gas spot price Monte Carlo simulations	112
5.4	Example of surface regression for the value function V performed by the LSMC algorithm	113

6.1	Calculation example of a 911 Brent index formula on historical values	117
6.2	Discretization on a binomial tree of the admissible cumulated quantity for a swing contract with $\mathcal{K} = 3 = \frac{9-7.5}{1-0.5}$	130
6.3	Contract value and execution time with finite differences with the relationship $\delta_t = \delta_z = \frac{1}{k}$ for $k = 1, \dots, 10$	133
6.4	Contract value with respect to the number of basis function N_{ξ}	134
6.5	Some sensitivities of LSMC algorithm	136
6.6	10^5 simulations of daily spot price and monthly index price	138
6.7	Optimal control $u^*(t, p, i, \hat{i}, z)$ obtained with FD algorithm when $t = 15, \hat{i} = 60$ and the cumulated quantity is $z = 1$ or $z = 2$	141
6.8	Analysis of the NMC output	142
6.9	Analysis of the LSMC output	144
7.1	Optimal control u at time 0 with $T = 10$, as a function of cumulated gas quantity Z and spot price P	155
7.2	Value function V at time 0 with $T = 10$, as a function of cumulated gas quantity Z and spot price P	155
7.3	Optimal control u at time 0 with $T = 30$, as a function of cumulated gas quantity Z and spot price P	156
7.4	Value function V at time 0 with $T = 30$, as a function of cumulated gas quantity Z and spot price P	156
7.5	Optimal control u at time 0 with $T = 20$, as a function of cumulated gas quantity Z and spot price P	157
7.6	Value function V at time 0 with $T = 20$, as a function of cumulated gas quantity Z and spot price P	158
7.7	Optimal control u at time 0 with $T = 50$, as a function of cumulated gas quantity Z and spot price P	158
7.8	Value function V at time 0 with $T = 50$, as a function of cumulated gas quantity Z and spot price P	159
8.1	Forecast error reduction for wind generation in Germany as forecast time horizon reduces, from [1]	162
8.2	Average absolute spread between day-ahead and intraday markets (GME – Italian markets) from January 1, 2013, to June 30, 2014	163
8.3	Average absolute spread between day-ahead and intraday markets (OMIE – Spanish markets) from January 1, 2013, to June 30, 2014	164
8.4	Average high-low spread in EPEX Intraday market, from January 1 to July 31, 2014. The chart indicates a high degree of volatility	164
8.5	A typical path of intraday price in a continuous market	165
8.6	Liquidity: average transactions number and volumes for every hour	166
8.7	Percentage of transactions already done with respect to time left to delivery	167
8.8	Trend identification: qualitative tests	168

8.9	Trend identification: qualitative tests	168
8.10	Distribution of the random variable P&L Π for a strategy that uses only the Italian DA market (called MGP) and a different strategy that uses also ID and unbalancing market	171
8.11	Example of the production of the PV plant for the first 330 hours	174
8.12	Cumulated performance of the strategy in the case when unbalancing is not allowed, i.e., the case when the final schedule after the last intraday market is exactly equal to the forecast energy production.	176
8.13	Ratio between expected P&L and expected risk	178
8.14	Calibration example of the dynamics (8.6)	182
8.15	Example of wealth of trading strategies	183

List of Tables

3.1	Input data used for the solution of the problem, from [4]	82
3.2	GBM parameters	83
3.3	Interest rate 4%	87
3.4	Interest rate 8%	87
3.5	Descriptive statistics distributions with incentives	89
4.1	Synoptic representation of investment alternatives	93
4.2	Static DCF analysis of investment alternatives	95
5.1	Constraint of the VPP contract	110
5.2	Forward term structure used in the example	111
6.1	Summary of the main results of the three algorithms presented in this chapter for a one-month contract	135
6.2	Summary of the main results of the three algorithms presented in this chapter for a one-year contract	137
8.1	Structure and organization of intraday markets in Europe	162
8.2	Excerpt of the strategy after it has been completely implemented in all markets	177
8.3	Average risk of the strategy versus benchmark	177
8.4	Performance OU	183
