## **CHAPTER 1 Emerging roles of plant growth regulators for plants adaptation to abiotic stress–induced oxidative stress..... 1**

Akbar Hossain, Biswajit Pamanick, Visha Kumari Venugopalan,  
Ulkar Ibrahimova, Md. Atikur Rahman, Ayaz Latif Siyal, Sagar Maitra,  
Subhrajyoti Chatterjee, Tariq Aftab

|                                                                                                                           |    |
|---------------------------------------------------------------------------------------------------------------------------|----|
| <b>1.1</b> Introduction.....                                                                                              | 1  |
| 1.1.1 Heat.....                                                                                                           | 3  |
| 1.1.2 Drought.....                                                                                                        | 4  |
| 1.1.3 Salinity.....                                                                                                       | 5  |
| 1.1.4 Heavy metal stress .....                                                                                            | 6  |
| 1.1.5 Water logging.....                                                                                                  | 6  |
| <b>1.2</b> PHs in abiotic stress tolerance .....                                                                          | 8  |
| 1.2.1 Function of classical PHs for adaptation of plants against abiotic stress .....                                     | 8  |
| 1.2.2 Role of specialized stress-responsive hormones for adaptation of plants against abiotic stress .....                | 11 |
| <b>1.3</b> Physiological mechanisms of plant growth regulators for plants adaptation to abiotic stress .....              | 30 |
| 1.3.1 Plant growth models incorporate eco-physiological mechanisms .....                                                  | 31 |
| 1.3.2 Role of PGR in abiotic stress.....                                                                                  | 32 |
| <b>1.4</b> Nonhormonal growth regulators and their role in stress.....                                                    | 32 |
| 1.4.1 Polyamines (PAs).....                                                                                               | 33 |
| 1.4.2 Salicylic acid (SA).....                                                                                            | 34 |
| 1.4.3 Jasmonic acid (JA).....                                                                                             | 35 |
| 1.4.4 Brassinosteroids.....                                                                                               | 35 |
| <b>1.5</b> Developmentally regulated genes and their role in growth regulators induced by abiotic stresses in plants..... | 37 |
| 1.5.1 Heat shock proteins.....                                                                                            | 37 |
| 1.5.2 Aquaporin genes .....                                                                                               | 37 |
| 1.5.3 MAP kinases.....                                                                                                    | 38 |
| 1.5.4 Transcription factors .....                                                                                         | 38 |
| 1.5.5 MiRNA .....                                                                                                         | 40 |
| 1.5.6 HMG and histones .....                                                                                              | 41 |
| <b>1.6</b> Conclusions.....                                                                                               | 41 |
| Abbreviations .....                                                                                                       | 42 |
| References .....                                                                                                          | 43 |

## **CHAPTER 2 Role of salicylic acid–induced abiotic stress tolerance and underlying mechanisms in plants .....73**

Kanval Shaukat, Noreen Zahra, Mohammad Bilal Hafeez, Rubina Naseer, Aaliya Batool, Hina Batool, Ali Raza, Abdul Wahid

|            |                                                       |    |
|------------|-------------------------------------------------------|----|
| <b>2.1</b> | Introduction.....                                     | 73 |
| <b>2.2</b> | Role of SA in mitigating major abiotic stresses ..... | 74 |
| 2.2.1      | High temperature .....                                | 74 |
| 2.2.2      | Chilling and freezing .....                           | 74 |
| 2.2.3      | Drought .....                                         | 75 |
| 2.2.4      | Salinity .....                                        | 75 |
| 2.2.5      | Heavy metal stress .....                              | 76 |
| 2.2.6      | UV stress.....                                        | 81 |
| <b>2.3</b> | SA-induced modulation in metabolic processes.....     | 81 |
| 2.3.1      | Interaction of SA with other hormones .....           | 81 |
| 2.3.2      | Interaction of SA with secondary metabolites.....     | 82 |
| 2.3.3      | SA and osmolyte interaction.....                      | 83 |
| <b>2.4</b> | SA-induced signaling mechanism .....                  | 83 |
| 2.4.1      | Involvement of SA in ROS signaling.....               | 84 |
| <b>2.5</b> | SA-induced gene regulation under abiotic stress.....  | 85 |
| 2.5.1      | Heavy metal stress .....                              | 85 |
| 2.5.2      | Heat stress .....                                     | 86 |
| 2.5.3      | Drought stress .....                                  | 86 |
| 2.5.4      | Salt stress .....                                     | 87 |
| <b>2.6</b> | Conclusion and future prospects.....                  | 87 |
|            | Abbreviations .....                                   | 88 |
|            | References .....                                      | 88 |

## **CHAPTER 3 Physiological, biochemical, and molecular mechanisms of plant steroid hormones brassinosteroids under drought-induced oxidative stress in plants .....99**

Akbar Hossain, Visha Kumari Venugopalan, Md. Atikur Rahman, Md. Jahangir Alam, Abdullah Al-Mahmud, Md Ariful Islam, Ayaz Latif Siyal, Sagar Maitra, Tariq Aftab

|            |                                                                                                                     |     |
|------------|---------------------------------------------------------------------------------------------------------------------|-----|
| <b>3.1</b> | Introduction.....                                                                                                   | 99  |
| <b>3.2</b> | BR and their role in response of plants to drought stress .....                                                     | 100 |
| <b>3.3</b> | Role of BRs in growth and development of plants during drought stress .....                                         | 105 |
| 3.3.1      | Seed germination and plant growth .....                                                                             | 106 |
| 3.3.2      | Shoot and root growth.....                                                                                          | 107 |
| 3.3.3      | Leaves growth.....                                                                                                  | 107 |
| 3.3.4      | Chlorophyll and photosynthesis .....                                                                                | 108 |
| <b>3.4</b> | BRs interaction with endogenous plant hormones, osmoprotectants, and antioxidant enzymes during drought stress..... | 109 |
| 3.4.1      | Interactions between BRs and ABA .....                                                                              | 110 |
| 3.4.2      | Interactions between BRs and ethylene.....                                                                          | 111 |

|                                                                                                         |            |
|---------------------------------------------------------------------------------------------------------|------------|
| 3.4.3 Interactions between BRs and auxins .....                                                         | 113        |
| 3.4.4 Interactions between BRs and gibberellins.....                                                    | 113        |
| 3.4.5 Interactions between BRs and SA .....                                                             | 113        |
| 3.4.6 Interactions between BRs and polyamines .....                                                     | 114        |
| 3.4.7 Interactions between BRs and JA .....                                                             | 114        |
| 3.4.8 Interactions between BRs and NO.....                                                              | 114        |
| 3.4.9 Interaction of BRs with osmoprotectants and antioxidant enzymes<br>during drought stage .....     | 115        |
| <b>3.5 The molecular mechanisms of BR-regulated drought stress response in plants.....</b>              | <b>115</b> |
| 3.5.1 ABA signaling pathway.....                                                                        | 117        |
| <b>3.6 Conclusion .....</b>                                                                             | <b>118</b> |
| Abbreviations .....                                                                                     | 118        |
| References .....                                                                                        | 119        |
| <br>                                                                                                    |            |
| <b>CHAPTER 4 Mechanism and function of salicylate in plant toward biotic<br/>stress tolerance .....</b> | <b>131</b> |
| Parul Tyagi, Ayushi Singh, Anamika Gupta, Mrinalini Prasad, Rajiv Ranjan                                |            |
| <b>4.1 Introduction.....</b>                                                                            | <b>131</b> |
| <b>4.2 Importance of SA research on agriculture .....</b>                                               | <b>134</b> |
| <b>4.3 Plant–pathogen interactions.....</b>                                                             | <b>135</b> |
| 4.3.1 Surface resistance proteins.....                                                                  | 135        |
| 4.3.2 Local and systemic acquired resistance (SAR) .....                                                | 137        |
| <b>4.4 Part of SA in plant disease resistance .....</b>                                                 | <b>139</b> |
| <b>4.5 Classical and biochemical approaches to identify SA receptor.....</b>                            | <b>140</b> |
| <b>4.6 Regulation of level of cytosolic SA .....</b>                                                    | <b>142</b> |
| <b>4.7 Elucidation of signaling pathway according to different approaches.....</b>                      | <b>143</b> |
| 4.7.1 Regulation of SA accumulation.....                                                                | 143        |
| <b>4.8 Biosynthesis of SA .....</b>                                                                     | <b>147</b> |
| 4.8.1 Isomerizes chorismate (IC) pathway .....                                                          | 149        |
| 4.8.2 PAL pathway.....                                                                                  | 150        |
| <b>4.9 Function of the IC versus PAL pathways .....</b>                                                 | <b>151</b> |
| <b>4.10 Mode of action of SA .....</b>                                                                  | <b>153</b> |

**CHAPTER 14 Biogenic amines in plant cell at norma and stress: probes for dopamine and histamine .....357**

Victoria V. Roshchina

|                                                                                                  |     |
|--------------------------------------------------------------------------------------------------|-----|
| 14.1 Introduction .....                                                                          | 357 |
| 14.2 Common look on the role of catecholamines and histamine in plants at norma and stress ..... | 357 |
| 14.3 General principles of cell responses to biogenic amines.....                                | 359 |
| 14.4 Approaches for studying biogenic amines in plant cells.....                                 | 362 |
| 14.5 Occurrence of dopamine and histamine in cells.....                                          | 364 |
| 14.6 Location of biogenic amines in plant cell .....                                             | 365 |
| 14.7 Biogenic amines as markers of stress in plant cells and their adaptation to stress .....    | 367 |
| 14.8 Conclusions .....                                                                           | 372 |
| References .....                                                                                 | 372 |

**CHAPTER 15 Alleviation of abiotic stress by newly discovered fire-instigated hormone: karrikin.....377**

Shristi Sharma, Renu Sharma, Shabir A. Rather

|                         |     |
|-------------------------|-----|
| 15.1 Introduction ..... | 377 |
|-------------------------|-----|

|                   |                                                                                                                                              |            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------|
| 15.2              | Phytohormone in smoke .....                                                                                                                  | 377        |
| 15.3              | Discovery of karrikin .....                                                                                                                  | 377        |
| 15.4              | Chemical nature of karrikins .....                                                                                                           | 378        |
| 15.5              | Karrikins: abiotic stress responsiveness and tolerance .....                                                                                 | 378        |
| 15.6              | Crosstalk of karrikins with another phytohormone .....                                                                                       | 379        |
| 15.7              | Future perspective .....                                                                                                                     | 380        |
|                   | Abbreviations .....                                                                                                                          | 381        |
|                   | References .....                                                                                                                             | 381        |
| <b>CHAPTER 16</b> | <b>Role of sugars in crop stress tolerance under challenging environment .....</b>                                                           | <b>385</b> |
|                   | Ghalia S.H. Alnusairi, Mona H. Soliman                                                                                                       |            |
| 16.1              | Introduction .....                                                                                                                           | 385        |
| 16.2              | Role of sugars in important plant physiological processes .....                                                                              | 386        |
